Research Theme: "Entrepreneurship and Employment Among People with Disabilities: Trends, Challenges, and Policy Recommendations."

Author: Omar Ashurbaev

Co-Author: Umida Isanbekova

Abstract:

In this paper, the authors examine the roles of entrepreneurship and employment for people with disabilities with the view of identifying trends, gaps, and policy recommendations for improved economic participation and inclusion. The study uses data from the Department of Labor and employs social inclusion theory and the disability rights model to examine the structural barriers that prevent persons with disabilities from engaging in business and employment. Based on the variations in business ownership across veterans and racial/ethnic minorities, the article provides recommendations on how to promote policies for disabled entrepreneurs and employees. Some of them are; financial handlings; mentorship services; skill enhancement and development; and policy measures that encompass both the economic and social aspects of disability.

Keywords: Entrepreneurship, Disability, Employment, Policy Recommendations, Social Inclusion, Disability Rights, Veteran Business Owners, Racial and Ethnic Disparities, Economic Empowerment, Accessible Technologies.

INTRODUCTION

Entrepreneurship is a great path to economic empowerment because for people with disabilities it can be one of the few alternatives to employment in a traditional workplace because of the barriers. Self employment establishes,the conditions that provide for possibilities of economic inclusion and personal fulfillment as this way of life can lead to a chance for employees to tailor their professional lives to meet their needs and aspirations. Breaking down the systemic barriers and creating a pathway to becoming financially independent, and contributing to society, entrepreneurship gate is open for people with disability.

Such a comprehensive view of business ownership, selfemployment, and entrepreneurship is offered as a result of the Department of Labor's analysis. Critical disparities and opportunities within this demographic are showcased in the report, with 8% of veteran business owners reporting a disability compared to 3% of the general business population. These results also point to the necessity of finding and rectifying institutional factors that determine the occurrence of disabled people's entrepreneurial participation and success.

Using the Department of Labor's data in this study, this article also analyzes the prevalence of disability among different demographics, employment categories, and racial or ethnic groups as to discover key trends in entrepreneurship among people with disabilities. To locate the challenges at a holistic level, the article places these findings within the theoretical frameworks of social inclusion theory and the disability rights model. By intervening specifically, the barriers to entrepreneurial success can be overcome to better create an ecosystem of inclusion in which individuals with disabilities can thrive.

1. Disability Prevalence Among Business Owners

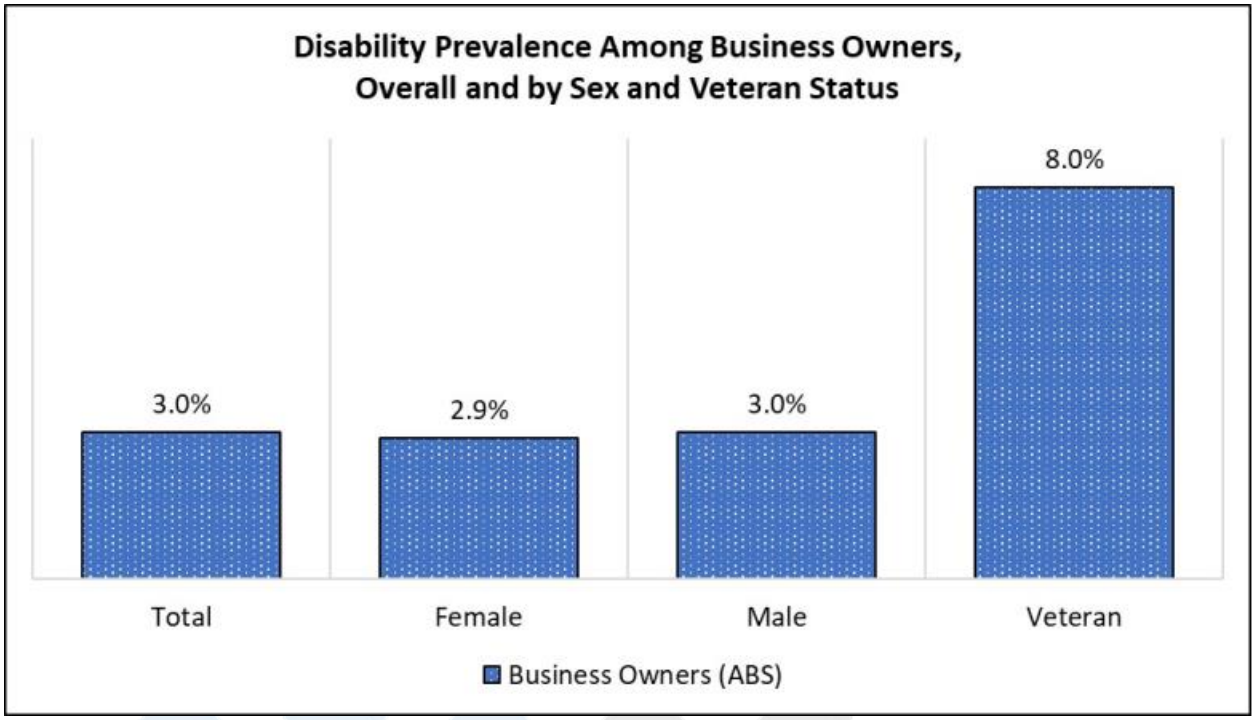

Entrepreneurship through a disability lens provides a critical lens on how disability impacts the opportunities of many to be entrepreneurs. According to the Department of Labor analysis, 3% of all business owners have a disability, and among veteran business owners this prevalence is 8%

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,

VOLUME-4, ISSUE-12

(Department of Labor, 2024). The stark difference between this and the other conditions speaks volumes about the special circumstances veterans face; many of whom will look to entrepreneurship as a way of coping with obstacles in traditional employment marketplaces. The study points to the need for tailored policy interventions designed to deal with those demographic challenges and opportunities.

Irrespective of the nation, veterans will have higher rates of disability caused purely because of the physical and psychological demands of military service. Self employment is a viable prospect for reemployment into the civilian sector for those who utilize their professional skills and past work in their endeavor. Theories frequently used to explain entrepreneurhip include the resilience framework which asserts that veterans have adaptive capacities to fit in their entrepreneurial ventures (Bonanno, 2004). But systemic barriers — limited access to capital and mentorship, for example — block success. Veteran entrepreneurs are critical programs like The U.S. Small Business Administration's (SBA) Boots to Business initiative for providing them with resources and training to help succeed (SBA, 2024).

Nearly half of male business owners and female business owners have a disability at a rate of 2.9% and 3% respectively (Department of Labor, 2024). The finding also counters conventional accounts of gender imbalances in entrepreneurship, especially with respect to disability. The near equal representation echoes that what motivates or barriers to self employment is near equal for the disabled man or woman. But a more detailed study sheds light on gender specific difficulties. Additionally, women entrepreneurs with disabilities face additional disadvantages – partially due to gender and partially due to disability biases– from underrepresentation of women, and reduced access to funding and mentorship. Dealing with these interfacing inequities involves a multidimensional pedagogical approach that primarily attends to the individualistic needs of different demographic groups (Griffin et al., 2020).

Its prevalence among business owners is also influenced by societal factors such as the shared values of networks et al. We derive the likelihood of the disabled to their entrepreneurship

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-4, ISSUE-12

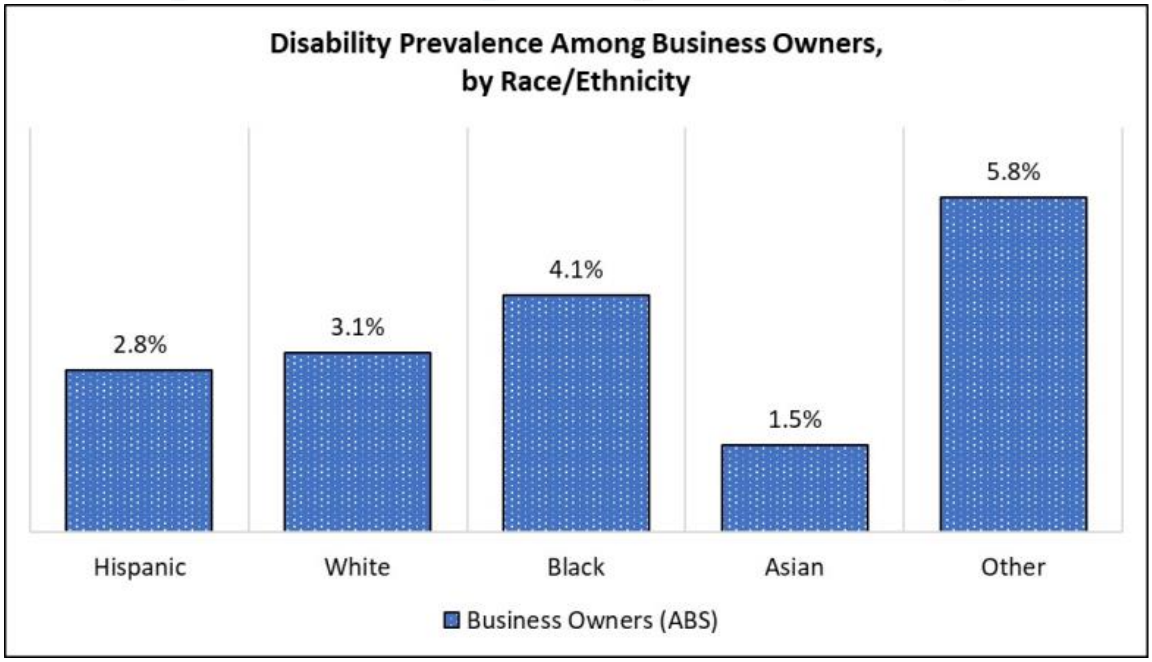

along the lines of cultural perceptions about disability, access to education and support systems. For instance, people may find it difficult to obtain resources or be accepted by society for setting up a business venture, in communities where disability is taboo (Oliver, 1990). On the other hand, expression of inclusive policies and social attitudes towards people with disabilities might create inclusive environments for people with disabilities to act as entrepreneurs.

These findings have profound policy implications. Financial support for disabled entrepreneurs should be widened to overcome capital constraints, including low interest loans and grant programmes. They also have access to mentorship and training programs that are being specifically designed for disabled business owners — including veterans — to increase their chances of entrepreneurial success. These efforts can be further bolstered through public private parternships, including collaboration between government agencies and disability advocacy organizations that create wide ranging support networks (Department of Labor, 2024).

The analysis disability prevalence among business owners reflects, in general terms, that there is a need for an inclusive entrepreneurial ecosystem. Through policy and stakeholder interventions, policy makers and stakeholders can break the barriers, enable people with disabilities to realize their complete entrepreneurial potential, and ultimately understand their positive impact on society. These also efforts also help the economy and achieve greater equity and inclusiveness.

2. Race and Ethnicity Among Disabled Business Owners

The racial and ethnic composition of disabled business owners gives us vital insight into how race and entrepreneurship intersect, as well as how disability shapes this intersectionality. Disability prevalence among business owners differs greatly by race and ethnicity, according to the Department of Labor's analysis. The prevalence is highest (5.8%) among people who have been classified as "Other," and second highest (4.1%) among people who are Black. However, only 2.7% and 2.4% of White and Asian business owners note a lower prevalence (Department of Labor, 2024). Highlighting these disparities illuminate the specific challenges and opportunities with which racial and ethnic minorities with disabilities face when pursuing entrepreneurship.

Challenges Faced by Minority Groups

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,
2024-6.875 ResearchBib IF: 8.848 / 2024

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-4, ISSUE-12

Systemic barriers, such as lack of access to capital, lack of mentorship, and inaccessibility to professional networks, are real bottlenecks preventing many a Black and other entrepreneur from achieving entrepreneurial success. Research reveals that these challenges are typically amplified for people with disabilities because they are racially and/or racially double marginalized as racial serving and/or agency persons with disabilities (Harris et al., 2020). For example, racial biases in the financial system could prevent Black entrepreneurs with disabilities from being able to get traditional bank loans because entrepreneurs with disabilities are perceived as a greater financial risk and there's a perception of greater risk with Black entrepreneurs.

Furthermore, race and disability intersect, and as combined 'others,' these minorities are shut out socially, like their access to access to education and training opportunities vital for business ownership. Oliver, (1990) social model of disability is based on the fact that it is societal structures rather than individual impairments which create the barriers which leads to non participation. Because these structural inequities are profiled for racial and ethnic minorities, targeted interventions are required to guarantee equal opportunities in accessing entrepreneurial resources to these minorities.

Policy and support Opportunities

To address these disparities such a stark policy response, which ups the stakes in achieving diverse representation for disabled entrepreneurs from underrepresented racial and ethnic groups, is necessary. For instance, community development financial institutions (CDFIs) can be an important source of culturally competent financial services to the needs of minority entrepreneurs with disabilities. Mentorship programs that connect successful minority entrepreneurs with would be business owners can also close resource and knowledge gaps as well.

Additionally, the Minority Business Development Agency (mbda) has some success in promoting minority entrepreneurship (mbda, 2024), grants, advisory services, amongst other things. Extending these efforts to include disabled business owners as the target of such support would strengthen the effectiveness of those efforts. These programs work to deliver both financial assistance combined with training in vital business skills to minority entrepreneurs looking to overcome systemic obstacles and establish profitable growth.

Intersectional Analysis

Using the intersectionality theory (Crenshaw, 1989), the triple burden that racial and ethnic minorities with disabilities confront may be analyzed. This theory focuses on the overlapping systems of oppression which needs to be addressed in order to make true inclusion with policies. For instance, knowing that Black disabled entrepreneurs need both financial support and anti-discrimination protections guarantees that interventions attack the roots of inequality, rather than its surface.

The Department of Labor's findings also show the effects that targeted policies for inclusiveness can have. As an example, providing tax breaks for businesses that hire disabled people of underrepresented groups can lead to a domino effect where the broader boom in enabling more inclusive hiring can be seen across industries. Equally, the initiatives to promote supplier diversity also offer market opportunity space for minority owned businesses with disabilities which further produces economic growth and resilience.

This racial and ethnic breakdown of disabled business owners highlights how intersectional approaches need to be taken to policy and support. Policymakers can erode systemic barriers in an

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-4, ISSUE-12

inclusive entrepreneurial ecosystem and enable potential of all people, regardless of backgrounds. As well as being an effective means of promoting equity, these efforts have a spillover into the positive effects of a more inclusive business environment on the overall economy.

3. Disability Prevalence in the Workforce

Disability prevalence in the workplace provides useful information about employment patterns and difficulties that people with disabilities encounter on the labor market. The Department of Labor's analysis finds differences in disability prevalence by employment category: 14.1 percent (highest) of the unincorporated self-employed veterans reported disability. This is in contrast to the low (3.9%) prevalence among wage and salary employees who obviously face different barriers than the disabled in the wage and salary population (Department of Labor, 2024).

Self-Employment as a Pathway to Inclusion

Self employment is often a viable alternative to regular employment for people with disability. People who opt to be their boss get to make their own rules. This idea has been supported by social inclusion theory that economic participation is a basic component of societal integration (Burchardt, 2004). But the data also shows that broader participation in self employment is stymied by systemic barriers.

Disability prevalence by gender is a marginal difference; men (5.7%) are slightly more likely than women (5.4%) to be self-employed. This trend may result from any of the above-mentioned societal factors such as availability of resources and cultural beliefs of entrepreneurship. Extra barriers for women with disabilities, caregiving responsibilities and gender discrimination, impede in their participation in entrepreneurial activities (Harris et al. 2020). These disparities must be addressed through targeted policies oriented toward the particular site where the confluence of gender and disability is concerned.

Challenges in traditional employment.

A traditional employment presents tremendous challenges for people with disabilities in workplace accessibility, discrimination and inadequate accommodations. According to the survey, these barriers exclude many people with disabilities from the formal workforce. This corresponds

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,
2024-6.875 ResearchBib IF: 8.848 / 2024

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-4, ISSUE-12

to Oliver's (1990) social model of disability which assumes that impediments to participation arise not in impairments but in societal structures. But the challenges for veterans are even greater: besides their disability status, they likely also wrestle with medical and mental health conditions related to their service.

In particular, there appears to be a pull for veterans to self employment to get around these barriers. There are programs, like the Veterans Entrepreneurship and Small Business Development initiative, meant to help veterans have the tools and resources it takes to become self employed. However the survey findings indicate that much more support in accessible affordable healthcare, adaptive technologies and financial support is necessary (Department of Labor, 2024).

The Role of Accessible Tools and Resources

Accessible tools and resources are truly critical to individuals with disabilities being successful in the workforce. Screen readers and ergonomic workstations are assistive technologies that level that playing field. Additionally, training programs focusing on marketable skills that those with disabilities can apply, including all things programming and data, can put those with disabilities on a level playing field out in the job market. Economic adaptation and growth are determined by skill development as stressed by Nelson and Winter's (1982) evolutionary theory of economic change.

While this progress has been made, the survey also shows a mismatch between resource availability and those who are self employed. For example, numerous disabled entrepreneurs say they find it difficult to obtain inexpensive financing to make investments in the necessary tools and technologies they must have to flourish in business. These gaps must be addressed by policymakers through granting, tax incentives, and subsidizing loans to resource acquisition.

Implications for Policy and Practice.

So to try to promote equitable participation in the workforce, there are interventions that are needed to compensate for the systemic barriers people with disabilities experience. Employed disabled people must be integrated into traditional roles at work, and to do that employers need to prioritize workplace accessibility, inclusive hiring practices. Self employed people need greater access to training, mentorship and financial resources.

It's also important to recognize, though, that government efforts (for example, the Workforce Innovation and Opportunity Act, or WIOA) can be instrumental in plugging these gaps by funding vocational rehabilitation and employment services. While the disability population spans both wage and wage substitute (self employment) segments, creating an inclusive ecosystem should be done leveraging public private partnerships.

It is evident from the disability prevalence in the workforce that systemic reforms are needed to make the society and the workplace more inclusive and accessible. Stakeholders can unlock the full potential of this untapped workforce by addressing the dimensional challenges those with disabilities face in traditional employment as well as self employment. Therefore, these are efforts that are critical to facilitating economic participation and are gaining ground on broader efforts of equity and inclusion.

4. Racial and Ethnic Breakdown of Disability Prevalence in Employment

Such racial and ethnic distribution of prevalence within employment categories represents a powerful lens to understand systemic inequities, and their effects on labor market outcomes. For racial or ethnic groups, rates of disability are highest among unincorporated self-employment,

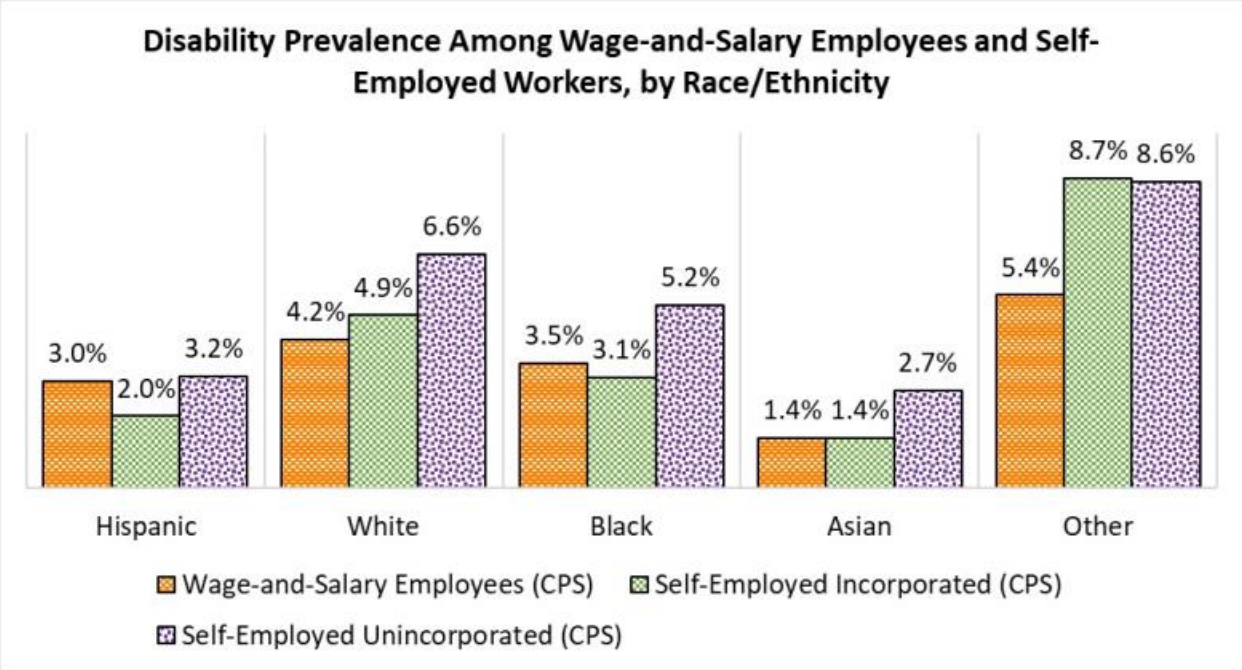

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,
2024-6.875 ResearchBib IF: 8.848 / 2024

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-4, ISSUE-12

where "Other" and White workers account for 8.6 and 8.7 percent, respectively. There are sharp differences, on the other hand, for wage-and-salary workers, who report significantly lower disability prevalence across all racial and ethnic groups (Department of Labor, 2024).

Worker Class Category	Total	Female	Male	Veteran
Wage-and-Salary Employees	3.8%	3.8%	3.7%	8.8%
Self-Employed: Incorporated	4.2%	4.1%	4.3%	11.4%
Self-Employed: Unincorporated	5.7%	6.0%	5.5%	14.1%

Disparities in Employment Outcomes

These disparities combine with underlying systemic problems that overlap across both race and disability. According to research, racial and ethnic minorities with a disability are doubly disadvantaged compared with others in such negotiations, given the presence of discriminatory hiring practices, lack of access to a quality education, and lesser social capital (Harris et al., 2020). For instance, Black and Hispanic people with disabilities have lower employment rates; and are more likely to hold precarious or informal job roles, which less often offer legal protections or accommodations.

An alternative to traditional employment for individuals with disabilities experiencing barriers exists in the form of unincorporated self employment. But this category has its own peculiar issues. Self employed folk have many issues with regards to access to capital, heathcare and adaptive technology. Already disproportionately harmed by structural inequities in financial systems and access to healthcare, racial and ethnic minorities are disproportionately affected by these barriers. The system of employment equity that Crenshaw's (1989) intersectionality theory calls for is predicated on the simultaneous addressing of these overlapping systems of oppression

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,
2024-6.875 ResearchBib IF: 8.848 / 2024

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-4, ISSUE-12

and allowing dependent systems that are in themselves not oppressive to be optimized to achieve equitable labor market outcomes.

Role of Worker Class and Employment Sector

According to the Department of Labor's data, there are huge differences in disability prevalence between different worker classes, and in different employment sectors. For example, workers in "Other" racial categories have higher disability prevalence among self employed workers than among wage and salary workers. This trend argues that self employment may offer a measure of freedom and also flexibility to marginalized individuals not afforded by the traditional organization of work inside work places. But it also suggests that people who do not have access to wage and salary work with available benefits and job security.

Furthermore, the sector of employment also forms outcomes. Racial minorities with disabilities are underrepresented in well paid industries such as technology and finance and, conversely, overrepresented in industries like agriculture and retail, data shows. These disparities are based on historical exclusion and occupational segregation, which continues to constrain upward mobility of minority groups with disabilities (Burchardt, 2004).

Policy Implications and Solutions

Such disparities are addressed through the tailored policy interventions taking into account distinct needs among racial and ethnic minorities with disabilities. With the help of Community development financial institutions (CDFIs) and minority-focused grant programs, expanding access to capital has the ability to remove financial barriers for self employed individuals. Enforcing anti discrimination laws and promotion of workplace accommodations for wage and some salary employees are done like that it could foster inclusivity.

Currently, programs like the Workforce Innovation and Opportunity Act (WIOA) or the Minority Business Development Agency (MBDA) are not designed to intentionally serve consumers who intersect with race, disability, and employment, and therefore should be expanded to do so. Vocational training, mentorship or resources to navigating systemic barriers should be offered through these initiatives. In addition, these efforts can be compounded through partnership programs between government agencies and community organizations to get the interventions to the hardest to reach populations.

Technology and Innovation important role.

New technology can transform disparities too. Certain accessible tools — like screen readers, voice-to-text software, and ergonomic equipment — let people with disabilities work more fully. Racial minorities with disabilities can overcome workplace barriers through access to these technologies via initiatives that subsidize access to these technologies. In the evolutionary theory of economic change of Nelson and Winter (1982), technological innovation is considered to be a determinant of greater economic inclusivity and lesser inequality.

The racial and ethnic breakdown of disability prevalence in employment raises the need for an intersectional approach to equity in the labor market. Stakeholders can ensure a greater inclusive workforce by moving away from a traditional view and adopting a perspective that celebrates diversity and its driving power for economic resilience. Efforts at empowerment must extend with equal force beyond the rank of the individual to include broader work towards societal progress.

5. Policy Recommendations and Future Directions

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,
2024-6.875 ResearchBib IF: 8.848 / 2024

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-4, ISSUE-12

Findings on levels of disability prevalence among business owners, workforce participants, and self employed individuals point to vastly unexplored spaces which may lead to more inclusive entrepreneurship and employment. To move ahead on these disparities, targeted policies will aim to help people with disabilities overcome those systemic barriers and fully participate in the economy.

Financial Support for Disabled Entrepreneurs

Among other things, one of the most persistent challenges of individuals with disabilities who want to be self employed has to do with access to financial resources. Much needed capital for disabled entrepreneurs may come through programs such as community development financial institutions (CDFIs) and federal grant initiatives. Yet, these programs must be widened and targeted with disability specific considerations for adaptive tech and compliant infrastructure (Department of Labor, 2024).

Financial burden of starting and scaling enterprises can also be reduced by giving disability owned businesses low interest loans and tax incentives. TakeCanada, for example; they effectively ran a disability focused enterprise grant program which involves financial aid plus the mentorship and training component which other countries can duplicate (Harris et al., 2020).

Mentorship and Skill development programs are launched for the students.

Tailored to the special challenge faced by disabled entrepreneurs, mentorship and skill development programs can dramatically improve their chances for success. There are good opportunities for robust mentorship networks that provide advice on business strategy, funding and navigation through market, through partnerships between government agencies, non-profits and private sector organizations. For example, small Disabled entrepreneur s can turn to the Small Business Administration's (SBA) Boots to Business program, which is thus far directed at veterans, but whose model can be adapted to meet Disabled entrepreneur sponsored programs' needs (SBA, 2024).

High demand skills: such as programming, data analytics and business management must be prioritized in vocational training programs too. It is consistent with the evolutionary theory of Nelson and Winter (1982), for they argue that skill adaptation in a dynamic economic setting is better than when it occurs in a static environment. Additional skill acquisition can also be provided by accessible training platforms, e.g., in terms of online courses for mobility or sensory impaired individuals.

Inclusivity Human Centered Design

Technology has the ability to fill accessibility gaps. It can enable the provision of subsidized access to assistive technologies from screen readers to adaptive communication tools and ergonomic work stations to enable individuals with disabilities to participate more fully in entrepreneurial and in employment activities. Tech companies and governments can create and disseminate these tools, and make them both affordable and accessible to as many people as possible (Burchardt, 2004).

Accessibility to infrastructure is equally important. Universal Design standards can be mandated for public and private spaces by policies in order to remove physical barriers for disabled entrepreneurs and employees. Governments and businesses can promote participation of persons with disabilities in the economic life through encouraging the development of inclusive environment.

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,
2024-6.875 ResearchBib IF: 8.848 / 2024

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-4, ISSUE-12

Priority in the area of encouraging employer inclusivity.

Creating an inclusive work environment for people with disabilities is a society's duty, and employers warrant the lion share of this responsibility. Tax credits that will encourage hiring disabled workers, for example, will lead the change. Workplace accommodations, like flexible schedules and remote work arrangements, also may help meet the needs of employees with disabilities.

Simplifying it can also create attendant changes in how society sees disability. Highlighting how disabled entrepreneurs and employees contribute to your company will also play an important role and help to foster a culture that breaks through stereotypes. This is consistent with Oliver's (1990) social model of disability in which a central concern is the influence of societal attitudes in determining what is accessible and included, and what is not.

Collaboration among Stakeholders

An ecosystem that supports those with disabilities must be developed together by governments, private entities, and community organizations. Large scale initiatives like regional entrepreneurship hubs, that offer training, mentorship, and financial support, might be funded by the joint forces of public private partnerships. Global institutions can also support disability inclusive economic policies as they have global institutions of different forms (Crenshaw, 1989).

Future Research Directions

The Department of Labor's analysis provides a lot to build off of, but there is a need for further research to explore the more intricate experiences of disabled entrepreneurs by demographic and region. Longitudinal studies can be used to study the impact of policy interventions and to note areas of improvement of the effectiveness of a policy intervention. Furthermore, qualitative research that lifts up actual voices of disabled people can guarantee that policies are based on lived experiences.

Sustainable policy support, technological innovation and colaboration will shape the future of disability inclusive entrepreneurship and employment. Systemic barriers need to be addressed and inclusive initiatives invested in to enable people with disabilities contribute meaningfully to the economy. As we create these efforts, they will increase equity and inclusion and unleash the unrealized potential of a diverse, capable workforce, as well.

Conclusion

This paper demonstrates that entrepreneurship and self-employment act as positive avenues for economic and social change for disabled people. The Department of Labor's findings show that there are clear inequalities and potential within this population, it is clear that there is an immediate requirement for efforts to mitigate inequity. As a result, people with disabilities have the financial burden, lack of access to training, and inadequate adaptive technologies and other resources.

The study shows that self-employment offer flexibility and independence that is preferable for people with disability since they are likely to face challenges in the traditional employment. However, there are still many gaps that remain based on gender, race and ethnicity and those who are part of the most vulnerable groups. For example, the disparities that exist regarding race affecting the acquisition of resources make minorities with disabilities unable to attain financial independence. To meet these gaps it is necessary to create policies with an approach that takes into consideration equity, inclusion and intersectionality, as set out by Crenshaw in 1989.

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,
2024-6.875 ResearchBib IF: 8.848 / 2024

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-4, ISSUE-12

Thus, the following measures can be suggested for the development of inclusive entrepreneurship: increase in financial resources availability, improvement of mentoring and training services, and integration of suitable technologies. This shows that in order to make interventions effective, there is need to have cooperation between the government, the private sector and other non-governmental organizations. Initiatives such as MBDA and WIOA are good examples of how the problem of systemic minorities' disadvantage can be tackled, while also helping people with disabilities find their way to entrepreneurship.

In addition, more people's awareness, more workplace diversity and inclusion, which promote the transformation of the social values toward disability. Thus, the organization of these efforts in connection with the overall economic objectives, including the development of technology and sustainable development, will make it possible for people with disabilities to be productive members of society and achieve personal and financial success.

Future work includes continued research and data collection to track future improvements and further policy development. Research that follows the progress of disabled entrepreneurs over time, and compares their results with other subjects, can be useful to assess the results of the interventions. Further, the use of qualitative research to give voice to people with disabilities makes policies an advocacy of real-life experiences and concerns.

In conclusion, the prospects for the self-employment and entrepreneurship as forms of empowerment for individuals with disability is therefore enormous. If the barriers to entry that affect this demographic are removed and the ecosystem around them is made more inclusive, this demographically diverse and capable group can be tapped into fully. It is for these reasons that these efforts will not only improve the standing of equity and inclusion but also economic innovation and improvement, which will ensure that everyone is able to do well.
