One of the main tasks facing Uzbek linguistics today is to create a national corpus of the Uzbek language, thereby expanding the practice of using the Uzbek language, turning it into an Internet language, and developing various programs. The national language corpus is a system with the possibility of electronic search in order to determine the characteristics of the national language units, a collection of digitized written and spoken texts of the natural language [B. Mengliyev, 2021]. It is known that in recent years, a lot of work has been done to strengthen the position of the Uzbek language as a state language. In particular, in the Decree of the President of the Republic of Uzbekistan Sh. Mirziyoyev dated October 20, 2020 "On measures to further develop the Uzbek language and improve the language policy in our country", all scientific, theoretical and practical matters related to the Uzbek language the task of creating an electronic national corpus of the Uzbek language, which contains information, is also set [Sh. Mirziyoyev, 2020].

Corpus search provides the user with an array of examples of all forms of a particular word, the ability to see the source of the examples, the meaning and explanation of the word in philological dictionaries, and the right and left sides of the searched word. the list of words, the frequency or statistics of the use of the same word by this or that author, the literal and figurative meanings of the word, the hidden model (possibility) of the use of the word, in different periods of language development allows to determine the state of use [B. Mengliyev, 2018]. Associative units are of particular importance in determining the hidden model (possibility) of all forms of a particular word and word usage. In the analysis of the linguistic landscape of the world, it is important to study the issue of a person's perception of the external world and its reflection in language. The role of associative thinking in the reflection of the world in language, the associative connection of language units, their integration into certain groups according to this connection, the role in the formation of a sentence or text shows that the associative approach is of high importance.

Associative approach to language learning, methods of associative analysis do not allow learning language materials separately from its owner. On the basis of associative analysis, the perception of reality, cognitive knowledge, linguistic ability, linguistic memory, and reserve of lexical units of the speakers of a certain language are studied. Associative linguistics, which works on the basis of the

materials of associative experience, mainly studies the language and its units in a pure state, in other words, in this direction, the natural state of the language before speech use is analyzed. Associative relationship is the relationship of language units with each other in connection with human psychological imagination. As noted by the famous linguist A. Nurmonov, "...linguistic units, apart from the speech process, are united in certain groups in the memory based on some common sign. For example, the word education is associated with several words such as school, book, teacher. It is not difficult to see that such a relationship has a completely different character from the syntagmatic relationship. The next relationship does not have longevity, it is localized in the brain and belongs to the treasure stored in the memory of each person. Such a relationship is an associative relationship" [A.Nurmonov, 2012: 98].

Associative connection of lexical units in an antonymic relationship is also based on semantic relatedness. It is known that any conflict requires opposing members. The interrelation of opposite parts through opposition causes them to remember each other in the memory of the speaker. This situation means that semantically conflicting lexemes also form lexical associations in the language. For example, a distant lexeme is associatively connected with a nearby lexeme, a bitter lexeme with a sweet lexeme based on the antonymic relationship [D. Lutfullayeva, 2017: 29]. Here we analyze the results of the associative experiment. The following responses were given to the lexeme white by the test takers: color, snow, silk, cotton-colored, black, yellow, flow, white, brightness, heat-proof, white nursing mother, white blouse, white gauze, white paper, black paper, white bread, white dog, black dog - all one dog, prone to white color, clear face, white body, white skin, white face, white wrist, whiteness - milk-yogurt, whiteness, whiteness, blackness, vodka, white poshho, white plaster, white plaster, a person without sin, whose honor has not been tarnished; right, truth, distinguishing between black and white, distinguishing black from white, gray hair, hair and beard, white hair, the white of the eye, a leaky spot that appears in the pupil of the eye, veil, egg white, the black and white of his eyes, let his mangle be white, white road, wear white, mourn, turn pale, white heart, black inside, white gold, cotton, white milk to white, blue milk to milk blue, displeased with one's child and turn away from him, white blessing, blessing, consent to start doing something, permission given with pleasure, permission, white tea, white washing, white combing, to wrap white, to betroth, to make one's child white, white, etc.

I. In the associative field, the white lexeme enters into a paradigmatic relationship with the following units: 1) synonymous relationship: white: sutrang, cotton-colored, prone to white color; 2) express the opposite meaning: a) antonymic relationship: white: - black, white dog - black dog, betrothal - mourning, white heart - black inside, white paper, black paper; b) enantiosemic relation: the enantiosemic unit of the blessing from the square is also applied to the betrothal and the death ceremony. Also, the lexeme of whiteness expresses the meanings of white and shroud, which are presented to suitors as a sign of consent to the wedding; c) antisemitic attitude: white - black; 3) homonymic relationship: the lexeme "white" is related to the Arabic word meaning "disobedient, disobedient, unobtrusive, does not know how to respect": to make one's child white. 2) nesting relationship: units such as black, yellow, sutrang belonging to the same nest with the word white are included in the field; 3) species relationship: white: color, hue; 4) level relationship: white: white, cotton-colored, flowing, sutrang, prone to white color.

II. Grammatical-structural signs of associative field units: In the associative field of the white lexeme, the following types of connections are observed in the relation of stimulus word + associative unit: Subordinate communication methods:

a) Control method. The method of control is observed in the mutual syntagmatic relationship of the response reaction of clothing associated with the white impulse word. That is: to wear white;

b) Adaptation method: egg white; white dog, black dog - all one dog.

c) In the way of engagement: white-skinned, white-faced, white-wristed, white-bread, white-kofta, white-cloth, white-paper, Structurally, the associative field includes the following structural units: associations in the form of simple words: color, snow, black, yellow, flow, white, brightness, whiteness, paleness, etc.; associations in the form of compound words: sutrang, aqpadar, etc.; associations in the form of a compound: a mother who gives white milk, a white blouse, white gauze, white paper, white hair in her hair, a leaky spot appearing in the eyeball, etc.; associations in the form of a fixed unit (phrase): recognize black and white, distinguish black from white, the white and black

of his eyes, let his hair be white, white road, wash white, comb white, wrap white, etc. .

III. Derivative properties of associative field units. The following units based on the white lexeme were found in the White Associative field: whiteness, whiteness, whiteness, paleness, whiteness. IV. Pragmatic properties of associative field units. The associative field contains specific connotative units, some of which are directly related to the lexeme white: white wrist, white road, white heart. All these units served to express connotation in a figurative sense. Units such as betrothal, white blessing, whiteness, white milk given in the associative space of the white lexeme are of special significance due to their national-cultural character. It is known that the semantics of meaningful units in the language is naturally revealed through adjacent meanings (close, opposite, similar meanings). For example, the meaning of the white lexeme is clarified based on the meaning of the black lexeme. The associative meaning of the language unit plays an important role in this process. The associative meaning of a lexeme is realized through a word, like the lexical meaning, but if the lexical meaning is expressed in a lexeme, the associative meaning is formed in the linguistic mind of the language speakers in connection with a specific lexical unit. The associative meaning of the lexeme is formed not only on the basis of linguistic factors such as the semantic aspect, grammatical form, intonation feature, word formation structure, stylistic, dialectal sign, but also on the basis of extralinguistic factors. [D. Lutfullayeva, 2017: 17.] Such associative experience materials are also of particular importance in the creation and further improvement of the national corpus of the Uzbek language. The national corpus is a modern software system that provides wide opportunities for comprehensive language learning and creating dictionaries on various topics. It will be widely used not only by linguists, but also by specialists in any field.
