THE ROLE OF A POSITIVE ENVIRONMENT IN THE EFFECTIVE FORMATION OF A CHILD'S PERSONALITY

Nasullayeva Marjona Nazirjon kizi - Practitioner psychologist at secondary school No. 9, Kogon city, Bukhara region.

Annotation: A positive psychological climate of a high level can serve as a powerful tool for the harmonious formation of a person's personality under the influence of others (group, community). Psychological climate is realized under two main factors: the socio-psychological state of society and microsocial conditions. The socio-psychological state (conditions) of society is expressed in the conditions of treatment, values, and opportunities established by law, while microsocial conditions are expressed in the legal status, division of labor, environmental conditions, age or gender of a group or community, and the formation of mutual relations.

Keywords: Psychological climate, Positive high-level psychological climate, persuasion, psychological infection, imitation

Educational influence and education, taking into account the psychological characteristics of each age, ensure the effective development of self-awareness in a person in a timely manner. The earlier a child develops a sense of self-awareness, the faster a personal perspective, a sense of one's own rights, and an assessment of one's mental and physical capabilities will appear. At the same time, a mental barrier to the formation of behavioral vices is created. The effective formation of beliefs, worldviews, ideals, behavior, communication, and independent behavior in people largely depends on the above factors and reasons. This, in turn, is one of the most urgent problems in the current conditions of globalization. It is advisable to identify a person's initiative, desire to overcome difficulties and obstacles and, depending on the characteristics of age psychology, to form an effective, rational psychological protection for them by creating a spiritual motivation and effective psychological climate, an educational environment based on them. Even a person's longevity and preservation of his working capacity, living with a perspective plan and purpose are the fruits of interaction and communication taking into account age characteristics.

It is worth noting that the result of the influence of the psychological climate of the team (group) is expressed in the self-perception of a team (group) member (child, student). This, in turn, is expressed in the degree to which his efforts and activities are protected from the treatment and attitude towards him and his satisfaction with it, achieving internal and external psychological balance. These determine his emotional and sensory satisfaction.

It is known that a positive high-level psychological climate can serve as a powerful tool for the harmonious formation of a person's personality under the influence of others (group, community). Psychological climate is formed under the influence of two main factors: the socio-psychological state of society and microsocial conditions.

If the socio-psychological state (conditions) of society is expressed in the conditions of treatment of a person, values, and requirements established by law, opportunities, then microsocial conditions are expressed in the legal status, division of labor, environmental conditions, age or gender, treatment, and the formation of mutual relations in a group or community.

Usually, psychological climate is also understood as an emotional psychological mood and is expressed in the emotional and emotional states of mutual relations formed on the basis of the value

orientation and moral norms and interests of the participants of the community or group. Therefore, psychological climate is formed under the influence of the following factors:

• a set of socio-psychological characteristics;
• dominant and stable psychological mood;
• nature of the relationship;

Relationships, communication processes are carried out in 4 forms of interaction.

1. Persuasion is the process of logically substantiating a certain idea, reflection, product of thought. Persuasion usually covers the rational and emotional aspects of a person. The process of persuasion is expressed in the mutual suffering of reaching a common opinion in open and latent situations.

2. Psychological infection usually finds its expression in the perception of mental states (mood, suffering, experience).

3. Imitation (identification) is a form of psychological infection
which is carried out by repeating the mental properties, actions, and behaviors of others.

4. Unresisted influence is a form of influence of one person on another in which the recipient of the influence is under the influence of the thought and will of another person expressed in their words without resistance.

Thus, the main condition for unresisted influence is the potential of the influencer, on the one hand, and trust in him, on the other. Unresisted influence is the process of mutual influence of people on each other, which occurs in direct, indirect, and involuntary manifestations.

Unresisted influence can be exerted by another person and on oneself. Non-resistance influence is usually based on "instruction" (setting). It is worth noting that this influence is much stronger in children. Because in children the influence of the identification form of communication is very strong. Real communication and human relations mainly occur on the basis of trust, imitation, infection and non-resistance influences. It is worth noting that acts of unconsciousness (unconsciousness, unconsciousness) undoubtedly play a large role in their realization. The basis of the interaction of people with each other is the degree of their mutual dependence. Because during mutual contact, psychological processes do not stop occurring in a person and they differ from when he is alone.

At this point, it is worth noting that pedagogical communication and communication are a form of professional activity of the teacher, and are understood as a means of interaction between the teacher and other participants in the educational process. In carrying out their activities, the teacher communicates with students of different ages. This, of course, requires a communication process appropriate to each age group. With young children, the teacher has a more personal relationship, which requires helping them to master social experience and providing them with knowledge. It is advisable for each teacher to treat students in the same way as he treats his own child, brother, or relative.

Students of junior school age are the most active participants in the process of communicating with their teacher. This is explained by the narrow range of relationships in the student, the high sense of trust in their teacher (this feature may disappear in the senior school year, which is due to a number of reasons). At this age, the student trusts his teacher, holds him so close to him, and therefore analyzes all events, including family problems, with his teacher.

Such a relationship between a teacher and a student ensures the success of the pedagogical relationship and has an educational effect on students. If a teacher loses or does not have authority in the eyes of his student, such a relationship will be disrupted and the student will lose trust in his teacher. As a result, as we noted above, in higher grades, and sometimes even in primary grades,

VOLUME-5, ISSUE-2

students will lose trust and respect for the teacher. In such a relationship, the level of the teacher's educational influence decreases and has a negative impact on the success of mastering knowledge.
It should be noted that with younger school-age children, the teacher has more personal interaction, helping them to master social experience and imparting knowledge. The nature of the interaction between the teacher and the student changes in students of higher school age. Now the student enters into a relationship with several teachers. Naturally, the student cannot be as close to them as the primary school teacher. As a result, if subject teachers do not demonstrate a personal desire to ensure the success of establishing relationships with students, the level of interaction in the upper grades will be disrupted and may lead to a decrease in the level of mastery.

It is worth noting that by correctly forming the “I” system and replacing them with “we” characteristics, a high psychological climate is created in the team and groups through the formation of high-quality communication and mutual relations.
