Abstract. This article examines the methodology of using the integrated learning method in teaching philosophy in the credit-module system. The article discusses the methodology of using the integrated learning method in teaching philosophy in the credit-module system.advantages of the method application methodsThe article also analyzes the views of integrative methods and a number of authors. Experts have provided a number of positive results from the use of integrative teaching, as well as conclusions and recommendations.

Keywords: Integration, philosophy, credit module, method, methodology, interactive, subject, teaching method, didactics.

Login. Today, modernization of the education system, its adaptation to international standards and the introduction of innovative methods into the educational process are urgent issues. The credit-module system is an internationally recognized model of education, and this system requires specific approaches to organizing the educational process, compiling educational materials and assessing student knowledge. The discipline of philosophy, with its uniqueness and complexity, requires special attention in the modular education system.

The use of integration in education appeared at the end of the 20th and beginning of the 21st centuries. This trend has become one of the main categories of modern pedagogy. “The word “integration” comes from the Latin word integration – restoration, completion, “integer” – whole. The integrative approach reflects the objective integrity of systemic relationships at different levels (nature-society-man). During integration, the volume of interdependence increases and is regulated, the functioning of the parts of this system and the integrity of the object of study are regulated”[1].

Integrative learning is the organization of the educational process in the context of different disciplines and areas. This method allows students to master knowledge, skills and competencies in a holistic system. An integrated teaching approach enriches the content of the educational process, helps students understand the subject more deeply, and develops their critical thinking skills.

Analysis of literature on the topic. As stated in the research of GSKostyuk: “If differentiation leads to an increase in mental processes and states (characteristics), then integration leads to ordering, subordination and placing its results in a certain sequence. Through integration, a new psychological process, a new structure of activity is formed. This new structure is formed by synthesizing previously separate elements,”[2]- gives an understanding of the essence of integration.

The subject of integrative pedagogical activity is the organization, conduct and management of integrative processes in the field of educational theory and practice. The goal of integrative pedagogical activity is the formation of new integrative products of one or another quality in all areas

of the personality: spiritual, cognitive, effective (emotional-valuable), psychomotor areas,[3]- is described in the scientific literature as follows. "As a psychological basis for the process of integrating school education, the ideas of psychologist YA Samarin about associative thinking can be taken. The essence of these ideas is that any knowledge is an analogy, and the system of knowledge is a system of analogies. YA Samarin distinguishes the following types of analogies: - local (local, limited to a specific place, thing); - belonging to a system; - intra-system; - inter-system; - classifies the levels of mental activity according to the peculiarity of combining their analogies with the corresponding level"[4]His views are important not only for school education, but also for higher education institutions.

Research methodology. This article aims to develop proposals for solutions to problems related to the importance of using the integrated teaching method of philosophy in the modular education process.In the methodology of using the integrated learning method, module planning is of great importance. It is required to adapt the curriculum of philosophy to the credit-module system and to consist of clear and interrelated topics. It is necessary to determine the content of the module, taking into account the principle of integration when allocating a certain amount of credits to each module and selecting educational materials for each module.

The use of interactive teaching methods in educational methodology serves to further increase the attractiveness of the subject. In particular, it is recommended to use group discussions, projects, case studies, debates and other active teaching methods in the modular learning process of philosophy. These methods encourage students to engage in dialogue and think critically. For example, in the "Philosophy of Ethics" module, discussions on current ethical issues can be organized. When compiling educational materials, it is necessary to pay attention to the methodology of expressing philosophical concepts in simple and understandable language. In the integrated method of teaching philosophy, the practical significance of the topic is further increased by presenting facts and examples from other disciplines.

Integrative methods of teaching philosophy in a modular education system are discussed in scientific articles and works related to the work.was explained based on the cited texts.

Analyses and results. If the subject of the integration process in education is the teacher, the student and their groups, then the object of this process is schools, institutes and universities. "Integration as a pedagogical phenomenon is understood as the process and result of the mutual penetration, interdependence and synthesis of various knowledge, methods and types of activity. Such a process, of course, implies consistency in the content of education across different modules, as well as the selection of forms, methods and means of teaching determined by the general goals of education"[5]Also, the essence of the integration process in education has two meanings:

- to create in students a "good idea of the world around them" (here integration is the goal of education);

- finding a common platform for bringing subject knowledge closer together (here integration is a means of education)"[6]. Taking into account the above and the educational goal, educational tools

are determined. LN Bakhareva in her article “Integration of primary school lessons on the basis of local history” emphasizes that “Integration is a process of bringing together and connecting disciplines carried out together with differential processes, a higher level of understanding that helps to create new, whole, integrated sections, and implements interdisciplinary connections.”[7]We also mentioned the integration of philosophy and literature in our research. In particular, we offer various integrative methods in teaching philosophy to students in universities.

In the Ethics - Philosophy of Education section of philosophy, the true essence of concepts such as morality, character, decency, goodness, kindness, humanity, justice, and hard work should be instilled in students. In teaching these topics, it is advisable to integrate the science of philosophy with the science of literature. In this regard, the use of great didactic works created in the East is effective. For example, Kaykovus's "Qobusnoma", Yusuf Khos Hajib's "Qutadgu bilik", Ahmad Yugnaki's "Hibat ul-haqoyiq", and the creative heritage of A. Navoiy and Z. M. Bobur, the listed concepts are revealed through realities.

About kindness:

"If you want to treat me well,
Be kind, O Khagan of the people.
Don't hold onto the skirt of a thousand noble ones,
But be kind in your actions and words.

About hard work:

If he knows the trades, he is perfect, complete,
If the useless ones can do it, that's fine.

***

The young man reaches out his hand, touches the craft,
The great mountain bowed its head like a lion.

***

Learn knowledge, learn a craft, hold it heavy,
The end of the world will hold you back.
Learn, study, don't walk in vain,
This kind of earth day shines at night.

Goodnessand about evil:

Don't join in the evil, don't be evil,
Do not be with someone who does evil.
May your politics and actions always be noble,
Don't be confused again"[8].

Excerpts from the given workis more effective than learned speech, and through this, a reading culture is formed in students. In addition, it can be seen that ethics - the philosophy of education - is related to disciplines such as sociology, psychology, and ecology.

According to researcher O. Otajonov, “The components of an integrative approach can be: organizational-methodological, activity-practical and theoretical-substantive. The organizational and methodological component involves the integration of teaching methods (discussions, project

method, moderation, deliberation, interactive games, discussions, round tables, festivals, competitions, conferences, work technologies, etc.). The activity and practical component involves the integration of educational forms that contribute to the development of critical thinking and creativity, the use of creative tasks that contribute to the formation of personally significant and professional qualities of a person. In addition, the researcher, when implementing this approach, presents the main questions of the topic under study using Internet resources, video plots, problem situations, cognitive tasks. At the integration stage - effective cooperation between teachers and students, reflexive-evaluation activities"[9]offers. We also use "VEER" in teaching philosophy.[10]We present the technology. This technology is considered relatively complex and involves use throughout the entire lesson. In the first stage of this technology, students can freely express their existing knowledge at the beginning of the lesson. In the second stage, they enrich their knowledge during the lesson, gaining understanding through deep reflection. In the last stage of the technology, the knowledge gained is systematized. This technology is effective in studying the topic of ontology in philosophy. Students are asked what knowledge or information they have about concepts such as Being, Time, Existence, Nature, Social Being, Human Being, Reality, Matter, Motion, Development, Space, Time, Substance, Substrate, Forms of Motion, Megacosm, Macrocosm, Organic Matter, and after listening to the answers, the teacher explains the topic. In the final stage, previous knowledge and acquired knowledge are compared, contrasted, and a conclusion is made.

In addition, we present the "Lotsi" method, which is designed to memorize theoretical information in philosophy. This method helps to remember the information that needs to be stored in memory correctly, without confusing it. The essence of this method is that the student brings to mind places and paths that are familiar to him. He places the knowledge that needs to be acquired in these paths and places in his imagination. He begins to memorize through imagination. This method is effective in studying the periods of the emergence and development of the science of philosophy. Cosmocentrism is important in distinguishing between theology, classical philosophy, or ancient Eastern philosophy, the philosophical thought of ancient Babylon, Egypt, India, and Central Asia, and the philosophical views of the medieval Eastern Enlightenment thinkers such as Al-Farabi, Ibn Sina, and Al-Biruni.

"Experts identify the following positive outcomes of using integrative learning:

1. Students are ensured to have a deep and solid mastery of a relatively complete and integrated part of the material being studied.

2. Favorable conditions are created for involving students in various forms and forms of activity, and for optimally combining frontal, group and individual forms of organizing activities.

3. Ample opportunities are created for teachers and students to work together, and cooperation, mutual assistance, and humanization of education are manifested in the learning process.

4. The teacher will have the opportunity to integrate various forms of organizing and integrating education into forms that ensure and support student activity in the learning process (for example, group lessons, discussions, lectures, and independent work) within the framework of the school day.

5. Forced education of students will disappear.

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-5, ISSUE-3

6. Conditions are created for true differentiation of education, taking into account the age, mental, and physical characteristics of students.

7. The kaleidoscope-like nature of the school day will disappear, resulting in less preparation for lessons for students and teachers."[11].

In addition to the positive features listed above, the integrated teaching method is a source of new scientific evidence that confirms the teacher's knowledge of the subject matter through knowledge gained from other subjects. At the same time, due to the exchange of scientific knowledge of students' activities, we can prevent psychological states such as boredom, fatigue, and irritability.

Conclusion. The use of an integrated educational method in teaching philosophy in the credit-module system helps to increase the effectiveness of the educational process, to deepen students' knowledge, to develop critical thinking and problem-solving skills. An integrated approach allows us to present philosophy not only as a theoretical science, but also as a science that can be applied in practice and plays an important role in solving real-life problems. At the same time, it is important for teachers to be ready to use an integrated method in the educational process and to create conditions for students to actively participate in this process.

Through an integrative approach, philosophical problems can be considered in connection with other disciplines (history, political science, sociology, psychology, literature, etc.). This helps students to understand the issue in depth and approach it comprehensively. The methodology of studying philosophy in integration with other disciplines develops in students the ability to analyze different points of view, compare facts and justify their opinions, and develops critical thinking in them.

Also,An integrative approach helps to present philosophy as a science that can be applied in practice, not just theory. It increases students' interest in science.
