LEARNING TO USE ACTION GAMES IN TEACHING VOLLEYBALL TECHNIQUES

Haydaraliyeva Dildora Gairatjan qizi,
2nd year master's degree from Tashkent Chemical International University

Annotation: This article presents theoretical information about the role of play in the development of children, the importance of games in the development of a child's personality, the inclusion of children in the game, as well as an analysis of its stages.

Key words: children's games, creative games, the role of games in raising a child, critical thinking, creative abilities, creative approach, educational institution.

President Of Our Country Sh.M.On the initiative of Mirziyoyev, many activities are being carried out in the following years to pay great attention to the development of physical education and sports in the country. Modern sports facilities and sports fields are being built in each educational institution, namely general secondary schools, vocational schools and higher educational institutions. It is provided with sports equipment and equipment necessary for physical education and sports training. At the time of these reforms, the tasks of educating the youth of our country as physically competent and spiritually mature are expressed.

Physical education is of great importance in educating the younger generation as a healthy and harmonious person. The main goal of physical education is wellness, and physical education activities have a health-improving effect. Especially important are the health-improving importance of morning badantarbia training and fresh air activities, walks, tourism training. In this, the body is influenced by Sun, air and water treatments. With this, the body's ability to resist diseases increases.

Vital movement skills (walking, running, jumping, stopping, hanging, blatant, sliding, etc.), the role of action games in the formation of qualities inherent in professional skills acquisition (speed, strength, agility, ingenuity, attention, memory) and sports techniques are incomparable.

For centuries, folk pedagogy and practice has made the most effective use of action games, especially national folk games, not only in the upbringing of children, but also in the spiritual-cultural, domestic-professional and physical formation of older people.

Research scientists working in the field of sports over the past 20-30 years have been proving the advantage of using action games in the practice of training athletes .

It is known that a task, instruction or performance of Labor and sports exercises of standard content quickly exhausts a person. But, performing such actions on the basis of National Games has a positive effect on a person's psyche, pushing back the duration of fatigue. Therefore, the use of action games specific to different content is of particular practical importance in sports training, especially in the initial preparation of young athletes.

Games are divided into different categories with their co-ownership (universality), multi-functionality, and wide impact. In particular, these include the games that develop physical qualities, points, pronunciation, sniffing, entrepreneurship, accounting, etc.qualities. But, whatever the game, it will contain an action element or a set of actions.

Action games are fundamentally different from sports games in terms of their content and essence. Action games do not require specific delimited regulatory factors such as specific preparation, specific competition rule, sportswear, duration, area, participant composition, such as sports games. Only one action game can be played in different places, over time, in clothing in content (in terms of

VOLUME-5, ISSUE-3

number). The most important are the free and involuntary movements observed during the action game (non-standard movement direction, screams, cheerfulness, etc.) that produce a positive emotional state (reaction). This condition, in turn, helps to "bypass" or appear later, fatigue complications that arise faster in sports training (or when performing a standard series of exercises). This means that the theoretical considerations inherent in the action games mentioned above determine their potential in physical education and sports. Therefore, the importance of action games, including folk National Games, in the training of young athletes is incomparable.

It is known that action games represent the painting, udumi, traditions and ethnogenetic features of various peoples and elates. For Shuing, such action games are often referred to as folk games.

Ancient thinkers-scientists and educators recognized that it is possible to educate nations in a person, such as health, truthfulness, patriotic feelings, respect for an opponent and respect for nature, precisely under the influence of National Games. In this regard, Uzbek folk action games in particular have the power to form various vital habits, skills and skills. Folk games are the discovery of this people. Therefore, these games take an active place in his mind, in his fast work, in the upbringing of family and neighborhood.

Action games, including people's National Games, as a unique value, have only been revived after our country has achieved its independence, and are now gaining wide and rapid popularity among the population, especially among student youth. Folk action games as a scientific object are increasingly gaining a solid place from the attention of research scientists.

In recent years, only scientific literature has been published that proves that action games are an extremely smooth tool in the training of athletes, in the formation of movement skills and physical qualities .

Games concerning the teaching of the technique can include, for example, "break the ball", "run the relay with the ball", "put a barrier on the ball" and other similar games. The importance of action games and their advantage in shaping the physical and technical training of athletes is noted in a number of scientific and methodological literature .

A.I.According to Lisitsa (1991), action games are not only able to successfully formulate physical qualities, but can also effectively develop qualities such as accurate aiming, accurate movement, attention.

There are such specialized games that, as a result of their regular application, the progress of special physical qualities and technical training of young athletes is significantly easier.

F.A.Kerimov and N.YUsupov (2003), on the other hand, had a one-on-one "wrestling" element regarding the training of wrestlers, sorting out existing matches and determining their effectiveness.

Leading volleyball expert scientists E.K.Akhmerov (1985)and Furmanov (1979) proved the advantage of using special action games that are close to the nature of the volleyball game in teaching volleyball qualification techniques and in the initial formation of physical and technical training.

Leading experts in action games in Uzbekistan are scientists T.Usmankhojaev and F.Khojaev, A.A.Pulatov, SH.A.The pulatovs (1992, 2015) have made a number of recommendations regarding the organization and conduct of action games in different directions. In particular, they believe that it is advisable to pay attention to a number of issues when organizing and conducting action games.

- Promotes the physical perfection, health improvement, conditioning of students, the growth of body organs and general working capacity.
- Formation of knowledge and vital necessary skills of action that can allow you to move freely;
- Development of mental, mental, professional and volitional qualities;

- Education of general and special physical qualities;
- Courage, resourcefulness, ingenuity, development of entrepreneurial qualities are among them.

Games suitable for students of different classes, sorted out games played at different seasons of the Year, Day and evening, and managed to brighten up their essence. Most of all, experts argue that it is advisable to use such games in school sports sections, including children engaged in sports games, as “Cat and mouse”, “space”, “pile”, “Wolf Inside the ditch”, etc.

The scientific and methodological literature analyzed above proves that going to develop physical fitness from an early age is important not only in tempering children, strengthening their health, but also showed how to make them more interested in sports, allow them to quickly master the technical and tactical qualifications established in sports training. In turn, young children revealed that action games are a very effective tool in the effective formation of their physical qualities. But as can be seen from this literature review, there is extremely little data set that illuminates what action games are acceptable to use in the development of which Silent qualities. Scientific research on the use of specially adapted action games in the training of young volleyball players in particular and in the development of the qualities of jumping characteristic of a volleyball player is practically not found.
