Analysis of geographical features of economic polarization using the example of Europe, USA and Uzbekistan

Nazarov Didar Maxsat o'g'li
2nd year geography student
Urgench State University
named after Abu Rayhan Al-Biruni

Abstract. The article will cover the processes of economic polarization,the reasons for its origin , the consequences that occur and its impact on society. In this article, again, the main features of polarization, the differences between boulicity and cosiness, its imbalance on the example of the world and any region and territory are threatened. There is also an opinion on the topic about the social and cultural consequences of economic polarization, ways to prevent it. The article examines the problems of European Qualifications, economic polarization in the United States and Uzbekistan, and analyzes its geographical features.

Key words: economic polarization, polarization of monthly salaries, polarization of unemployment, economic and natural factors, labor resources, geographical features

Introduction. What is economic polarization? Economic polarization is the process of increasing the difference between different groups of society in terms of opportunities in terms of income, wealth or job opportunities in an economy. This phenomenon can usually be characterized by the reduction of the middle-income class and the increase in high-income and low-income differences. Although "polarization" is a relatively young concept in economic analysis, the phenomenon of polarization of wages and labor skills is considered as old as economics. One of the pressing and interesting issues of economic geography of the polarization of wages and labor skills will not be relevant. Economic polarization is also directly related to high technology automation, the process of filling vacancies with cheap labor of low-wage states. Also, current computer Tehnologies are able to control them. In many countries, such as India, disparities between the rich and poor populations have become so acute that it has made it a world-class "Land of disparities". India is ranked 4th in the world in terms of GDP size however, the growing population beyond Hat provides lower per capita rates.

MAIN PART. Economic development is always distributed in a disproportionate position by region,which is due to the influence of internal (resources, infrastructure development, workforce qualification) and external factors (geological and geomorphological conditions, Climate, Investments, Economic Relations). The contribution of external factors in the now increasingly developing world is huge. The growing economic dependence is increasing not only between economic centers and manufacturing enterprises, but also between different countries. The complexity of the polarization process is that they also affect society, the economy and the ecological environment in different ways. Therefore, the study of these processes and the development of mechanisms for their influence is an urgent problem, both scientifically and practically. The important event of the last thirty years, the polarization of labor markets, also greatly affected the economy. This restructuring of employment has led to wage inequality in many states. Although this phenomenon can be explained mainly by technological changes, International Trade can also be seen through the process of industrialization of certain regions. In these new conditions, more or less

protected labor market institutions, depending on the state, can slow down or, conversely, increase wage inequality and deterioration of the workplace. While wage inequality declined in the period following the Second World Strike, gaps continued to expand steadily after 1980. They are growing between lower and middle incomes of the population or between middle and high incomes. Large changes in job structure were added to the growth of inequality, which was unfavorable for intermediate jobs and favorable for those jobs that received the best moash. This change in the labor market goes back directly to economic polarization. Although the share of intermediate professions is shrinking, the share of the lowest and highest paid professions is increasing sharply. This process was 4% in the developed French state of Europe between 1980 and 1990.Polarization in Europe accelerated especially during the Great Recession.

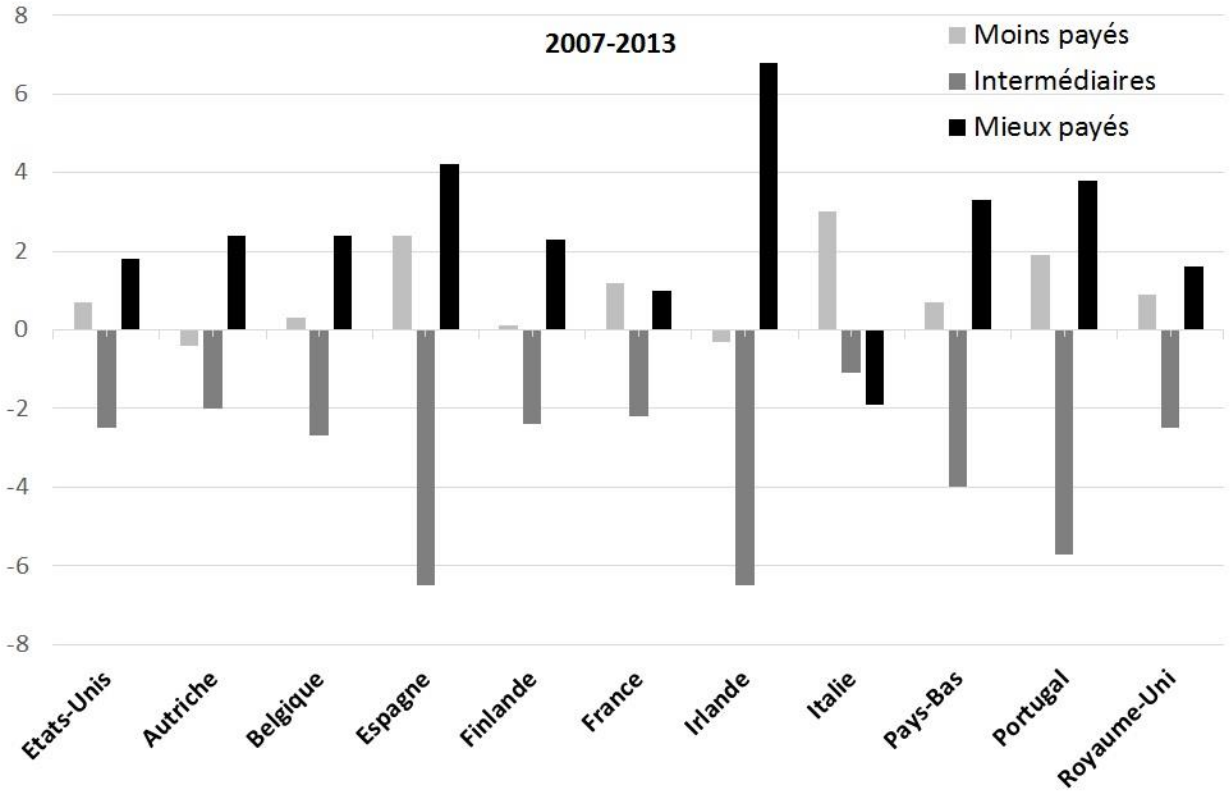

Figure 1.Evolution of professional shares (in interest points) in European countries during the Great Recession between 2007 and 2013.

The service society, which ruled at the end of the 20th century, is a solid foundation built on the basis of. Growing industries such as mass tourism, banking agencies and consulting firms increased the demand for personal requirements. But as globalization grew, this model of Service fell apart. Three factors contributed to its decline. The reason for the first was the factor of increasing competitiveness. According to the OECD, between 2000 and 2010, the share of service companies in certain sectors of global competition decreased from 10% to 20%. The decline was again influenced by the second factor cost infiltration. Between 2015 and 2020, wages in services increased by 15%, a steady increase for already weak margins. Finally, the third factor affected is the obsolescence of techniques and technologies. The rise of platforms such as Expedia and ChatGPT has caused the marginalization of professions that are important at the same time. It is estimated that 70% of service will be automated by 2030.

Us at economy problems of polarization

In 1970, economic polarization steadily deepened. The rich continue to Grow Rich, the poor are impoverished, and the middle class is squeezed. These dangerous trends continue today. According to the U.S. Census Bureau's estimates of income inequality and wealth in the United States since the census, the median income of one-fifth of families from 1970 to 2020 increased by 182 percent to us $ 253,000, while the median income of middle-income households and lower-Fifth families grew by only 133 percent to $ 72,00 and grew by 110 percent. In 1975, the average income of the Upper Fifth population was 10.3 times that of the lower Fifth population. By 2020 the gap had increased 17.4 times. Polarization among the rich and poor in the United States has been attributed to many factors, including Monopoly, electoral politics, government policy, weakened trade unions, and racial discrimination. The polarization and unequal distribution of wealth is an inevitable result of chronic disease and capitalism, causing both wealth accumulation and poverty in the United States. Since the 1970s, conservatism and liberalism have developed in the country, with bargaining and internationalization taking precedence over equality. The move to encouraging privatization in the U.S. economic system, abolishing progressive taxation, weakening trade unions, and loosening financial regulation made the elimination of wealth inequality more desperate.

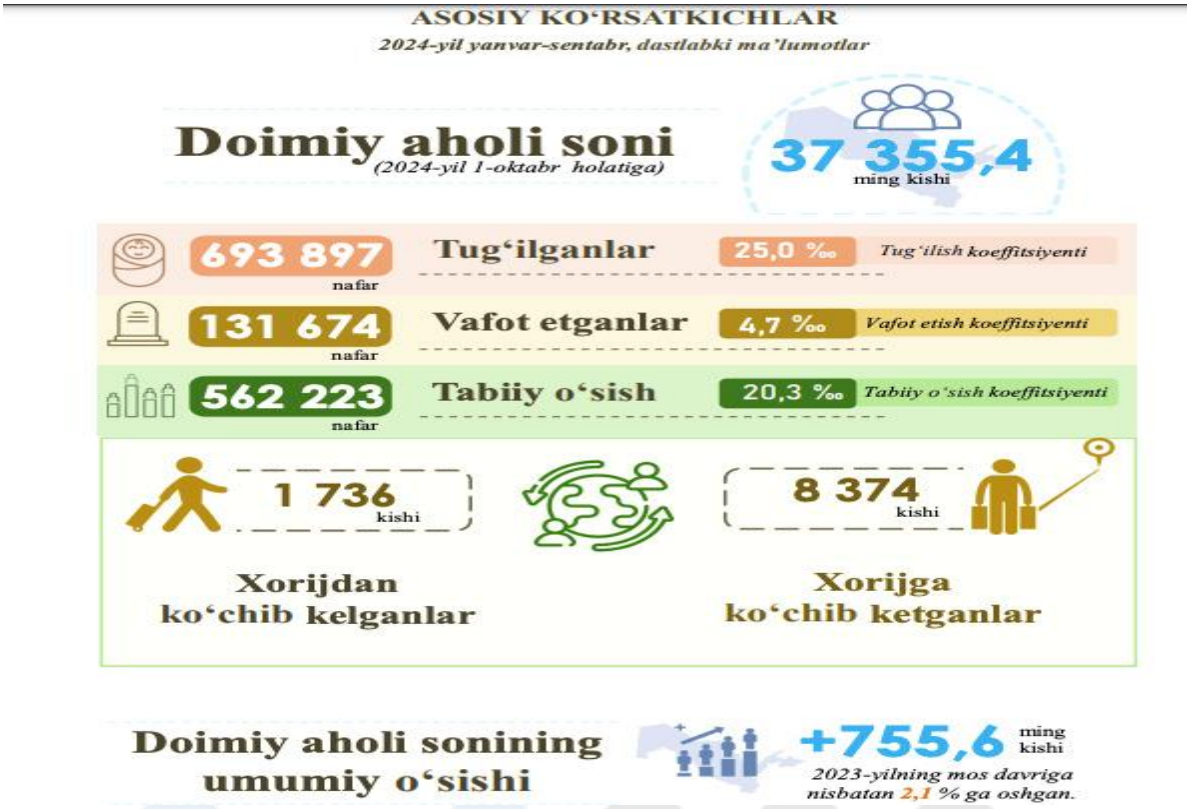

The problem of polarization of the economy in Uzbekistan

According to the data of 2020 in Uzbekistan, the difference between the city of Tashkent and the least Uzbek territory was 2.7 times. 4 years later, this figure increased by 3.6 times. The tofavut between the official moons in the regions is also getting bigger. **What is the reason?** According to the statistical agency, in terms of the administrative territorial division of Uzbekistan, 241.8 people have immigrated to its 14 regions (12 regions, the Republic of Karakolpagstan and the city of Tashkent) from abroad and from other regions of the Republic, 2229 are foreign citizens. According to statistics from January to September 2024, 1,736 people moved, the number of migrants and data on natural growth are also listed in the statistics:

The focus of this trend is that the proportion of immigrants to the city of Tashkent (92 thousand) and The Tashkent region (32 thousand) – 51.5% of the total number of immigrants. Leckie, however, had a large influx of settlers to these areas before. All this is a direct link to economic and social factors.

According to the results of last year, the highest per capita gross income was in Tashkent City (60 mln 594 thousand soums), and the lowest in enga was in Namanga Region (16 mln 849 thousand soums). Taking these as the highest and lowest, the gap between them is 3.6 times. At the end of 2024, the average monthly salary in Uzbekistan was 5.3 million rubles. The highest average monthly wage rates in the two administrative regions of Tashkent City (9mln soums) and Navoi region (6.7 mln soums) were higher than the average in the Republic, and in all other regions the rate was lower by varying amounts. When the Induvidual areas are compared, it can be seen that the inequality of wages in the cross-section of rarmoaks is also becoming medium. Yes, in recent years, salaries in Uzbekistan have increased significantly, but over the past five years, a specialist working in the field of Education has significantly impoverished compared to a specialist working in the banking industry.

Conclusion. The processes of economic polarization are considered to be related to geographical location, natural resources, human capital and political factors in bevosti. The growth and development of economic polarization in European countries, the United States and Uzbekistan is differentiated according to geographical aspects.

- A favorable geographical position for European Qualifications, well-established maritime and other transport networks, the rapid growth of the urbanization process with snapshots are the main factors of economic polarization. For example, Landon, Paris, Berlin, Rome, Moscow and other cities, which are considered major European cities, were formed as global economic centers, and the level of economic development around these cities was foal. These have the potential to attract

VOLUME-5, ISSUE-3

interregional trade and investment due to their favorable geographical position on the European continent.

-The fact that the U.S. State is also a favorable geographical position and rich in diverse natural resources, and is an economically geograkically snoozed state, and the introduction of modern technologies is a key factor for economic polarization. The United States is the country with the most powerful economy in the world, currently the volume of GDP is increasing by $ 30 trillion, leaving China behind in terms of this result. Public citizens with low World salaries are providing the U.S. labor market with cheap labor. Due to the qualifications of the permanent population residing in the state, polarization is observed in the cross-section of the territories. The U.S.'s own citizens will certainly receive a high salary, and at the same time the product ladder on the market will be reconciled.

- Uzbekistan is located in the Central Asian region of the heartland of the world, and the economy of the transition is among the countries. The highest results that study economic recovery in Uzbekistan in the hudular section correspond to the city of azim Tashkent, the capital of the country, and the Navoi region, which developed in the sonoat of mining and Metallurgy. Of course, the city of Tashkent has been progressing in all areas of industry since the time of the former Union and forms a large part of GDP. Navoi region, on the other hand, is much more developed in the field of non-ferrous metallurgy, the production of building materials and the chemical industry, which leads to employment of the population and a higher monthly salary. Another major reason for this is the low population size in the area, which in turn causes higher monthly salaries. In addition, the polarization of thinking salaries in other regions of the state goes back to economic, social and natural factors. This means that geographical aspects of economic polarization should be studied as well as dictated by the cross-section of Regions.
