# NATIONAL IDENTITY IN UZBEK MODERN ARCHITECTURE: ISSUES AND PROSPECTS

**Eshnazarova Solikha Zayniddinovna** – 2nd year student

Scientific supervisor: Candidate of Architecture, Associate Professor Nurmukhamedova **Shoira Zakhidovna**

Tashkent Kimyo International University

**Abstract**

This article analyzes the issues of preserving and reviving national traditions in modern architecture in Uzbekistan. Based on scientific research, the interior and architectural solutions of the Bukhara, Khiva, and Kokand Khanates periods have been studied, highlighting their aesthetic and functional features. The article also examines the reasons for the disappearance of national interior elements under the influence of urbanization and global trends in recent years. Proposed solutions include integrating ethnic interiors into tourism infrastructure, establishing a system for improving the qualifications of architects and designers, and developing legislative norms to encourage the preservation of national identity. The recommendations provided in the article aim to expand opportunities for preserving national architecture and applying it in modern projects.

**Keywords:** Uzbekistan, modern architecture, national traditions, interior design, Bukhara architectural school, Khiva architecture, Kokand Khanate, gypsum carving, ethnic interior, urbanization, cultural heritage, architectural solutions, craftsmanship, national design, tourism infrastructure.

## Introduction

National architecture is considered an important heritage that reflects the historical thinking, lifestyle, and cultural values of each nation. In a country like Uzbekistan, which boasts a centuries-old history and rich architectural traditions, architecture serves not only as a functional space but also as a source of aesthetic and spiritual values (1,3). Particularly, residential construction, mosques, madrasahs, and bazaars formed during the periods of the Bukhara, Kokand, and Khiva Khanates are vivid expressions of national identity (2,6).

In recent years, the processes of modernization and urbanization in construction and architecture in Uzbekistan have been rapidly developing. On one hand, the application of modern architectural technologies and new materials increases comfort and efficiency (2,7). However, on the other hand, the presence of interior and architectural solutions typical of national traditions is gradually decreasing. Especially in interior design, the dominance of Western styles has led to the loss of traditional elements such as ornamental patterns, carved wooden doors, and gypsum carvings (2,4,5).

This article addresses the issues of preserving, developing, and applying national architectural traditions under modern conditions.

Purpose. The goal is not only to preserve the heritage of national architecture and interiors but also to develop scientific and practical solutions for adapting them to contemporary social needs.

The national architectural traditions of Uzbekistan have evolved over centuries, shaped by the lifestyle, climate, religious beliefs, and local materials of the people. In particular, the architectural schools of the Bukhara, Kokand, and Khiva Khanates of the 18th–19th centuries have developed as prominent examples of national style.

In the Bukhara Emirate, residential buildings and public structures were built using local materials such as raw and baked bricks, wood, and gypsum, in accordance with the climate. Interiors

were richly decorated with gypsum carvings, wooden carved doors, calligraphic inscriptions, and geometric patterns. Architectural solutions aimed at ensuring air circulation, retaining warmth, and maintaining coolness were clearly visible in building designs.

The architecture of the Kokand Khanate was characterized by symmetrical courtyards, veranda-style rooms, and seasonal rooms. Decorative doors and windows, poplar columns, and colored gypsum panels highlighted the aesthetic aspect of national identity. Structures like the Khudoyorkhan Palace and the Kokand Jome Mosque are examples of grandeur and high-level architectural excellence (see Figure 1).

Traditional houses and public buildings like madrasahs and mosques in Khiva were built from clay and brick, harmoniously blending with the environment. Khiva's distinctive "ulli ayvon" (large verandas) and wind-regulating features ensured the courtyard's cool and protected atmosphere. Wooden carved columns and doors not only served structural purposes but also added aesthetic beauty to the interiors.

Decorative elements in national architecture, including geometric and plant-like patterns, Quranic calligraphy, and symbolic shapes, were used extensively. These elements were not only for beauty but also served as tools for moral and spiritual education. For example, floral patterns symbolized life and prosperity, while calligraphic inscriptions represented knowledge, religion, and wisdom.

In the past decade, modern architecture in Uzbekistan has developed rapidly. In the construction of new residential complexes, business centers, hotels, and infrastructure facilities, international styles—especially Western architectural minimalism—have become widespread. During this process, the presence of national architectural elements has gradually decreased.

Urbanization processes, the demand for high-rise buildings, and rapid construction technologies are limiting the integration of traditional features. Modern panel construction and concrete structures often exclude elements like gypsum carving or carved wooden doors. Standardized architectural systems and modular construction methods leave little room for individual design.

Figure 1: Examples of traditional Uzbek architecture and interior elements, featuring Bukhara, Khiva, and Kokand architectural schools, gypsum carvings, and carved wooden doors.

Among young designers and architects, European and American interior styles—such as loft, high-tech, and Scandinavian minimalism—have become increasingly popular, fueled by the influence of the internet and social media. These styles offer little space for national elements, often perceiving them as aesthetic contradictions.

Craftsmanship in fields such as gypsum carving, wood carving, and painting—which requires special skills—is on the decline, with fewer skilled masters, most of whom are elderly. Their expertise is not being sufficiently passed down to younger generations. Educational institutions lack dedicated courses on national architecture elements, resulting in architects gravitating towards modern but nationally detached designs.

Preserving and reviving national traditions in architecture and interiors in Uzbekistan is a strategic cultural priority. Reviving national architectural schools and harmonizing ethnic interior solutions with modern design requires scientific and practical attention. However, several obstacles and problems remain.

The system for training craftsmen in ethnic interior decoration—such as gypsum carvers, painters, wood carvers, and mosaic artists—must be re-established. Special educational courses under colleges and universities on "National Interior Arts" should be introduced. Organizing competitions and grant programs that encourage young people to learn national styles would also be beneficial.

It is necessary to conduct academic research projects to study and systematize the traditional solutions of each region's national interior styles. Based on this research, visual albums, digital 3D models, and interior design modules should be prepared for use in the fields of architecture and design. These resources would serve as practical guides for architects, designers, and students.

Conclusion. Preserving, restoring, and integrating national architectural and interior traditions into modern projects in Uzbekistan is crucial for safeguarding cultural heritage, strengthening national identity, and supporting economic development—especially in the tourism sector. The distinct features of each regional architectural school—Bukhara, Khiva, Kokand—represent a unique richness in interior solutions, material selection, and aesthetic perspectives. As analyzed in this article, the influences of urbanization, construction standardization, Western styles, and economic factors in recent years have led to a reduced application of national interior elements in modern buildings. In addition, the weak legislative incentives for promoting national identity, the shortage of master craftsmen, and gaps in the education system further deepen the problem.

A comprehensive approach is required: integrating national elements into architectural standards, supporting education and craftsmanship, incorporating ethnic interior solutions into tourism infrastructure, encouraging such projects, and creating a scientific and methodological resource base can bring sustainable positive change in this field.

The recommendations and solutions proposed in this article can serve as important steps toward reviving national architectural traditions under modern conditions and preserving the cultural face of the country.
