Abstract: This research aims to explore an adoptive learning system for English vocabulary based on machine learning. Vocabulary plays a crucial role in language acquisition, and effective vocabulary learning is essential for mastering English. The expansion of a learner's vocabulary depends on both individual effort and the tools used to support the learning process. Advanced learning systems can enhance motivation and improve learning efficiency. Importance of vocabulary ,especially among youngsters and new learners , stays in a first stages because of lack of base about English. Some researches work on some techniques how to learn vocabulary, how to teach student efficiently.
Keywords: vocabulary, structure, new techniques, learning process, traditional methods, training mechanism.

This paper introduces an adaptive English vocabulary learning system designed with machine learning techniques. It details the system's key components, overall structure, and database organization. As learners interact with vocabulary exercises, the system continuously updates their progress through a training mechanism. This process gradually refines the learning experience by adjusting and recommending suitable vocabulary content, ensuring a personalized and adaptive approach.

The experimental findings demonstrate that this system surpasses traditional methods in terms of learning efficiency, accuracy, and overall effectiveness. Human languages are the fundamental method of communication and they can be expressed be voice, sign, or writing. Many languages includes some recordings also. For nowadays world all the communities needs to know English as their second language , because the impact of English learning on academic and future job growth is significant. It concludes strong database , grammar, vocabulary, phrases and others. If the vocabulary is limited , they will not able to express themselves effectively even if they understand grammar. [1]English source words develop directly into an anglicism through the system of adaptation at four linguistic levels: orthographic, phonological, morphological and semantic. In our theory, these Anglicisms are called direct anglicisms , since they are the result of a development of their source word in English into an Anglicism in the borrowing languages. Another important thing while learning vocabulary is paying attention to pronunciation, because [2] In English, approximately 20% of words are written the same but have different pronunciations or meanings. These words are called homographs (same spelling, different pronunciation) and homonyms (same spelling and pronunciation but different meanings).

Examples:

1. Homographs (Different pronunciation):

Lead (/liːd/ – to guide) vs. Lead (/lɛd/ – a type of metal)

Read (/riːd/ – present tense) vs. Read (/rɛd/ – past tense)

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-5, ISSUE-4

Wind (/wɪnd/ – moving air) vs. Wind (/waɪnd/ – to twist or turn)

2. Homonyms (Same pronunciation, different meanings):

Bat (an animal) vs. Bat (sports equipment)

Bank (a financial institution) vs. Bank (side of a river)

Watch (a timepiece) vs. Watch (to observe) .

[3]Gr harmonia , from harmoza , to fit or put together, to join, to adapt. A setting, fitting, or joining together; the just adaptation of parts to each other , in any system or composition of things , intented to form a connected whole; just proportion of sound ; musical concord ; peace and friendship; a literatury work which brings together parallel passages respecting the same events and shows their agreement.

As English vocabulary learning becomes more important, numerous learning systems have been introduced. However, many of these systems are unscientific, resulting in poor learning outcomes despite the increasing number of learners. Jing et al. note that while there are plenty of English learning materials available, this abundance makes it harder for students to find suitable resources. Adaptive learning systems, which customize learning based on individual progress and needs, can help address challenges related to resource selection and assessment. However, the effectiveness of these systems depends on how data is structured, and traditional relational databases may not adequately capture the complexity of English knowledge. The vocabulary system in English can be categorized into different components:

Core Vocabulary – Basic words used in daily communication (e.g., "water," "house," "run").

Academic Vocabulary – Words commonly used in educational and professional settings (e.g., "analyze," "interpret," "significance").

Technical and Specialized Vocabulary – Terms used in specific fields like medicine, law, and science (e.g., "photosynthesis," "jurisdiction").

Slang and Colloquial Expressions – Informal words and phrases that vary by region and culture (e.g., "cool," "hang out").

English vocabulary is morphologically rich, meaning words can be formed or modified using prefixes, suffixes, and root words (e.g., "happy" → "unhappy" → "happiness"). Additionally, English heavily relies on phrasal verbs (e.g., "give up," "run into"), making vocabulary acquisition complex for learners.

2. Adaptation of English Vocabulary

The English vocabulary system constantly adapts due to cultural, technological, and social changes. Some key factors influencing adaptation include:

Borrowing from Other Languages – English has incorporated words from various languages, such as "café" (French), "piano" (Italian), and "tsunami" (Japanese).

Technology and Innovation – New words emerge with advancements, such as "selfie," "cryptocurrency," and "AI-generated."

Globalization – English adapts to different regions, leading to variations like British, American, and Australian English.

Contextual Changes – The meanings of words evolve over time. For example, "mouse" originally referred only to an animal but now also means a computer device

3. Learning and Adapting to English Vocabulary

Given its complexity and adaptability, learning English vocabulary requires structured approaches:

Contextual Learning – Understanding words in different situations enhances retention.

Adaptive Learning Systems – AI-driven and personalized learning platforms help learners acquire vocabulary more effectively.

Word Formation Strategies – Learning prefixes, suffixes, and root words aids in understanding new terms.

Active Usage – Practicing speaking, writing, and reading helps reinforce vocabulary acquisition.

This volume offers a comprehensive introduction to vocabulary for language learners who would like to know more about the way vocabulary works. If we say these all with one sentence is that English as a vocabulary system is constantly adapting and developing and evolving, absorbing words and phrases from various sources to help improve English language, communication between people and countries.

Conclusion: English as a vocabulary system shows its importance while learning languages. We can say that it is the main thing also. There are many methods, systems of vocabulary learning, traditional which can be done using suffix in order to create a new word, seeking from dictionaries and trying to keep in mind, modern methods such us borrowing words: nowadays many words are coming from another language families mostly if their roots are one, it can show 10-20 % words are borrowing word.
