ORGANIZATION, PLANNING AND MANAGEMENT OF INNOVATIVE PROJECTS IN LIBRARIES

Davlatov Soyibnazar

State Institute of Art and Culture of Uzbekistan Associate Professor of the "Library and Information Activities" Department, Candidate of Philological Sciences

Abstract: This article discusses the idea that such a universal form of planning innovations in libraries is an innovative project, which skillfully mastered the types widely used in entrepreneurial and social forms of human activity, unlike a plan, which has a simple linear structure, is not only a list of structured documents, but also a complex set of structured documents containing calculations, drawings, and evaluation criteria necessary for creating an object.

Keywords: Library, innovation, idea, plan, project, object, program, innovative design, concept, technology, resource, methodology, information, communication.

Аннотация: В данной статье обсуждается идея о том, что такая универсальная форма планирования инноваций в библиотеках является инновационным проектом, который искусно освоил типы, широко используемые в предпринимательской и общественной формах человеческой деятельности. В отличие от плана, который имеет простую линейную структуру - не просто перечень структурированных документов, а сложный набор структурированных документов, содержащих расчеты, чертежи и критерии оценки, необходимые для создания объекта.

Ключевые слова: Библиотека, инновация, идея, план, проект, объект, программа, инновационный дизайн, концепция, технология, ресурс, методология, информация, коммуникация.

Today, it is necessary to develop a certain universal form for assessing the effectiveness of innovative technologies and processes in libraries. Such a universal form of planning library innovations can be an innovative project, which is widely used in business and social forms of human activity, but has not yet become widespread in the library sector. As is known, a document describing the content of the specified activity, the procedure in the reference books under the plan is understood, a set of actions that are planned in advance, united for one purpose, requiring implementation, is considered a plan. Unlike the project, which has a simple linear structure, it is not just a list of structured documents, but a complex set of documents containing calculations, drawings, and evaluation criteria necessary for the creation of an object. Analyzing the content of the concepts of "Project" and "Program", we can say that they are clearly and generally interconnected. According to project management specialists, a program is a document whose content consists of projects. Programs are aimed at solving a whole range of issues related to changing management methodologies and technologies, changing organizational structures, motivating participants in the implementation of the program, and developing economic standards.

Library programs, Innovation projects, activities for creating programs, innovation plans are called design (or planning). Design includes all technical operations necessary for creating projects, including problem analysis, development of project documentation and planning for the implementation of the innovation process. Innovation design is a management method, especially an

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,

extremely important activity in planning. It is of particular importance in that it determines the procedure for implementing scientific, technological, production, organizational, marketing and other activities that lead to library innovations.

There is no single approach and definition to the concept of an innovative project in the economic and management literature. The understanding of a project under innovation is as follows:

1) a form of targeted management of innovative activities;

2) the process of introducing innovations;

3) a set of documents.

In the first two cases, the innovation project includes research, design and development, pilot testing, production development, its organization, launch, sales of new products and financial measures. In fact, we are talking about the entire cycle of innovation processes and their provision with financial resources, and the project concept includes almost all innovation activities and some elements of innovation management.

We can use the third approach and understand the innovative project, technical, organizational-planning, accounting-financial and other documents necessary for planning the implementation of a particular innovation document. In this case, achieving the result - the emergence of innovation or novelty, innovative design performs the function of documentary modeling of the innovative process and planning the innovative process, which includes the transition of the innovative idea to a documentary (material) form - plan, model, project. And the topics embody the most innovative project, the organizational principle of the innovative process.

An innovative project should be aimed at solving current problems of socio-cultural, economic, political and other significance in library practice. The list of problems of innovative projects depends on the conditions of the external and internal environment of the library and is compiled taking into account sociological research, monitoring, surveys, observations, analysis of library documents, etc. Currently, the innovative activities of libraries include the development of various and new information technologies, the creation of new information products and services, the modernization of all areas of library and bibliographic activity (acquisition, library bibliographic services, organization of library space, support for reading, etc).

The content of the innovation project is a system of resources, priorities of the library, time and activity performers interrelated in achieving specific goals. The purpose of the innovation project is to unite all participants in the planned innovation process, a set of all activities related to the implementation of innovations. The innovation project indicates scientifically sound technical, economic and technological solutions. Planning the result of innovative design as a process is a document that we call innovative, that is, a project.

According to the implementation period of projects, they are divided into:

- long-term (designed for a period of more than three years);
- medium-term (designed for a period of one to three years);
- short-term projects (implemented for a period of less than one year).

Many projects cover the entire library activity and include several functional areas. They usually require coordination of library activities with third-party libraries. Library institutions and organizations participate in joint discussions on the formation of a cultural environment in the region. As an integral part of the innovation process, design is used by a small number of libraries in their internal library practice. Therefore, most of the projects are of an investment or presentation

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-5, ISSUE-4

(advertising) nature, respectively. Their main goal is to attract extrabudgetary funds and demonstrate the creative potential of library staff.

The structure of projects for grants can be divided into an introduction and main parts.

The introduction contains brief information about the project: the name of the project, a description, a list of project managers and executors, its scope and sources of financing.

The main part contains a set of information about the content of the innovation (innovation), its implementation technology, the calendar plan of the innovation process, the provision of resources for the innovation process, the total cost of the project, project participants, the specific characteristics of the organization and the management of the innovation process, an analysis of risks and uncertainties in the innovation process, and an identification of the scope of influence on innovations.

The content of the news is determined on the basis of the strategy developed by the library, all types of marketing (product), technical, technological, social and organizational innovations are presented in the Library's activities.

There are four directions of innovative development of modern library and bibliographic practice:

- innovative changes in library and bibliographic technology;
- creation and development of new types of products;
- mastering new types of library and bibliographic services, including remote access to library resources;
- changing the organizational structure of libraries.

Technological innovations become a source of innovative changes in the practical activities of the library. Their adoption leads to a change in computer technology and its software, products, services and bibliographic activities, to a change in library technology, to a change in the library and bibliographic sphere.

The main part of the project content includes a description of the problem. It is very important to describe the current state of this problem and the main methods of resolving the existing contradiction, the justification of the selected innovation (innovation) and its advantages, its compliance with the existing experience of the library, the simplicity or complexity of implementation. Here, such features as the goals and objectives of the implementation of the innovation are described. The ultimate goal of the innovation is expressed in specific quantitative indicators and intermediate tasks for its implementation over a certain period of time.

Modern priority areas of the cultural sphere, such as the introduction of information and communication technologies into the sphere, the acquisition and preservation of library funds, the improvement of the skills of library specialists, the development of information services, support and encouragement of reading, etc., are being implemented within the state framework.

The peculiarity of regional programs is that they are formed and implemented on a national and regional basis, are in the interests of libraries in the regions. They involve a relatively small amount of work and resources (including financial assistance). The Legal Information Center was established in our Republic in 2001. It was established in only 14 regional libraries and was aimed at increasing the legal literacy of the population and youth in its territory.
