REMOTE EDUCATION METHODS FOR PATIENTS WITH CHRONIC HEART FAILURE

Tulaev Y.B

Tashkent Medical Academy

ABSTRACT

This article analyzes scientific literature on the effectiveness of remote education methods for patients with chronic heart failure (CHF). The study evaluates the impact of remote education on patients' understanding of their disease, self-management skills, adherence to medication regimens, and overall quality of life. The findings confirm that remote education positively affects the health and disease progression of CHF patients.

Key words: chronic heart failure, remote education, patient training, quality of life, telemedicine.

АННОТАЦИЯ

В данной статье проанализирована научная литература, посвященная эффективности дистанционного обучения пациентов с хронической сердечной недостаточностью (ХСН). Оценивалось влияние дистанционного образования на понимание пациентами своего заболевания, их способность к самоконтролю, соблюдение режима приема лекарственных препаратов и общее качество жизни. Результаты исследования подтверждают, что дистанционное обучение положительно влияет на состояние здоровья и течение заболевания у пациентов с ХСН.

Ключевые слова: хроническая сердечная недостаточность, дистанционное обучение, обучение пациентов, качество жизни, телемедицина.

Introduction. Chronic heart failure (CHF) is a pathological condition characterized by impaired oxygen and nutrient supply to tissues due to the heart's inability to pump blood efficiently. The number of patients suffering from CHF is increasing worldwide, currently estimated at approximately 26 million people [1]. This disease significantly reduces patients' quality of life, leading to severe complications and high mortality rates. According to studies, the five-year survival rate of CHF patients does not exceed an average of 50% [2]. In recent years, considerable attention has been given to improving treatment effectiveness and disease management strategies. In particular, remote education technologies are rapidly being integrated into healthcare systems. Remote education for CHF patients plays a crucial role in enhancing their knowledge about the disease, developing self-management skills, improving medication adherence, and reducing hospital readmissions. Therefore, this study aims to evaluate the effectiveness of remote education methods for CHF patients.

Materials and Research Methods. The study analyzed scientific literature, clinical trials, and meta-analysis results published between 2018 and 2023. Scientific databases such as PubMed, eLIBRARY, and Google Scholar were used to review approximately 15 scientific articles on remote education for CHF patients. The findings were analyzed to assess the impact of remote education on patients' quality of life.

Research Objective. The objective of this study is to analyze the effectiveness of remote education methods for CHF patients based on scientific literature and evaluate their impact on patients' quality of life, disease management, and hospital readmission rates.

Main Section. Chronic heart failure (CHF) requires long-term medication therapy, lifestyle modifications, and regular monitoring. Numerous studies indicate that the higher a CHF patient's knowledge about the disease, the better their self-management skills, leading to a reduction in hospital readmissions and mortality risk [3]. Traditional medical supervision methods rely on in-person visits, posing various challenges for patients, especially elderly individuals, those with mobility limitations, and those living in remote areas. Therefore, remote education for CHF patients is becoming a key focus of modern medicine. Several effective remote education methods are currently available, and some of them will be discussed below.

Telemedicine is one of the most modern and promising methods for monitoring CHF patients. It has been shown to reduce hospital readmission rates and healthcare costs. The effectiveness of home-based telemedicine has also been confirmed for other chronic conditions such as chronic obstructive pulmonary disease, bronchial asthma, coronary artery disease, arterial hypertension, and diabetes mellitus [4]. The implementation of telemedicine can significantly improve the quality and accessibility of medical services for CHF patients, particularly in rural and remote areas. The integration of telemedicine technologies into clinical practice enables earlier diagnosis, enhanced treatment monitoring, and faster responses to pathological changes and medical conditions.

Mobile applications and interactive platforms are becoming crucial tools in remote education for CHF patients. The rapid development of digital technologies has created new opportunities for increasing patient awareness, monitoring their health, and managing the disease. Mobile health applications (mHealth) can educate CHF patients, provide essential guidelines, and assist in disease control. Research shows that such applications help patients understand the causes and symptoms of CHF, adhere to medication regimens, and maintain a healthy lifestyle. These apps also allow patients to record key health indicators such as heart rate, blood pressure, and body mass while providing medication reminders and AI-driven personalized recommendations based on their condition [5]. Despite the available evidence supporting the effectiveness of remote monitoring programs, certain uncertainties still exist. Mobile-based interventions require further in-depth evaluation. Although sufficient data confirming the impact of mobile monitoring is lacking, its potential remains undeniable [6].

SMS and messaging systems are another significant approach in remote education, helping patients adhere to medication schedules, maintain a healthy lifestyle, and receive important CHF-related advice. This approach is widely used in medical practice due to its ease of use, broad coverage, and cost-effectiveness. A study conducted by English researchers found that medication adherence among CHF patients improved by 18-22% through SMS reminders [7]. Additionally, a systematic review by Adler and colleagues demonstrated that text messaging interventions effectively enhance medication adherence in secondary prevention of cardiovascular diseases [8].

Online courses and webinars are effective platforms for increasing CHF patients' knowledge and teaching them disease management strategies. These methods provide patients with interactive insights into the disease, proper nutrition, physical activity, medication adherence, and other essential aspects. A 2021 study showed that participation in interactive educational platforms significantly improved patients' quality of life and self-care abilities [9]. Furthermore, an Australian study found that online courses and webinars play a crucial role in raising awareness among CHF patients and

increasing adherence to medical recommendations [10]. These studies highlight that online education is a valuable tool for improving disease management skills among CHF patients, making its implementation in practice highly beneficial.

Conclusion. Remote education for chronic heart failure patients plays a crucial role in enhancing their disease management capabilities, improving quality of life, and reducing hospital readmissions. Research indicates that the use of telemedicine, mobile applications, and other remote education tools can lead to better health outcomes for patients. However, remote education also has certain limitations, and its effective implementation requires improving patients' digital literacy, developing infrastructure, and expanding remote healthcare services. In the future, further advancements in remote education technologies will contribute to innovative and effective solutions for CHF patients, ultimately improving their quality of life, extending their lifespan, and reducing medical costs.
