OPTIMIZING MULTIDISCIPLINARY STRATEGIES FOR ALLEVIATING PELVIC DISCOMFORT IN WOMEN WITH PERSISTENT ENDOMETRIAL INFLAMMATION

Tursoatova Sh.M
Tilyavova S.A
Samarkand State Medical University

Abstract. Persistent endometrial inflammation, or chronic endometritis (CE), affects 12–25% of women seeking reproductive care, often manifesting as debilitating pelvic discomfort that disrupts daily life. In Uzbekistan, where CE is diagnosed in 10–18% of gynecological patients, fragmented care exacerbates suffering. This randomized controlled trial (RCT) explored innovative multidisciplinary strategies—targeted antibiotics, acupuncture, and mindfulness-based stress reduction (MBSR)—to relieve pelvic discomfort in 160 women aged 20–40 across Tashkent, Fergana, and Bukhara clinics from March 2023 to December 2024. Participants were randomized into four groups: antibiotics, acupuncture, integrated (antibiotics-acupuncture-MBSR), and usual care (control). Primary outcomes were discomfort severity (Pelvic Pain Impact Questionnaire, PPIQ) and inflammatory resolution (biopsy-confirmed). Secondary outcomes included emotional well-being (PHQ-9), fertility potential (ovulatory cycles), and intervention uptake at 8 weeks and 6 months. The integrated group reduced PPIQ scores by 50% (8.5 ± 1.5 to 4.3 ± 1.0, $p<0.001$) and achieved 80% inflammatory resolution versus 50% in controls ($p<0.01$). Acupuncture alone eased discomfort by 35%, and antibiotics resolved inflammation in 65%. Emotional well-being improved markedly in the integrated group (PHQ-9 6 ± 2 vs. 12 ± 3 in controls, $p<0.001$). These results champion a holistic approach, offering Uzbekistan a practical framework to enhance women's health and informing global CE care.

Keywords: chronic endometritis, pelvic discomfort, antibiotics, acupuncture, mindfulness-based stress reduction, women's health, multidisciplinary care

Introduction. Imagine waking each day to a gnawing ache in your pelvis, a constant reminder of an unseen battle within. For women with chronic endometritis

(CE)—a subtle but stubborn inflammation of the uterine lining—this is reality. CE affects 12–25% of women with fertility challenges or unexplained pain, with 60–70% reporting pelvic discomfort that dims their vitality [1]. In Uzbekistan, CE touches 10–18% of women visiting gynecologists, yet many endure months of misdiagnosis due to scarce tools like endometrial biopsy, available in just 15% of clinics [2]. This discomfort, often described as a heavy, pulsing ache, disrupts work, intimacy, and joy, with 20% of sufferers facing anxiety or isolation [3].

Antibiotics like doxycycline can quell CE's inflammatory fire in 60% of cases, but discomfort lingers for many, hinting at deeper triggers—nerve sensitivity, stress, or muscle tension [4]. Emerging therapies offer hope: acupuncture, rooted in pain modulation, cuts discomfort by 20–30% in gynecological trials, while mindfulness-based stress reduction (MBSR) soothes the mind's role in pain perception [5, 6]. In places like Sweden, blending these with medical care boosts recovery by 35%, but Uzbekistan's clinics lean on pills alone, with alternative therapies reaching <3% of patients [7]. Rural Fergana, where 50% of women travel hours for care, feels this gap acutely [8].

VOLUME-5, ISSUE-4

This study dives into this challenge, testing antibiotics, acupuncture, and MBSR—alone and together—to ease pelvic discomfort in Uzbek women with CE. Spanning Tashkent's bustling hospitals, Fergana's modest clinics, and Bukhara's rural outposts, it weaves urban and rural stories. Aligned with Uzbekistan's push for better women's health, it seeks a path to relief that's practical, personal, and profound [9].

Relevance of Work. Pelvic discomfort from CE is no small matter in Uzbekistan, where 10–18% of gynecological patients grapple with it, and 30% report it as "life-altering" [2]. Beyond pain, CE fuels infertility (25% of cases) and emotional strain, with 15% of women showing depressive symptoms [3]. Rural Bukhara's women, often diagnosed late due to 70% specialist shortages, face worse odds [8]. Globally, antibiotics tackle CE's root in 60% of cases, but pain persists in 40% without holistic care [4]. Acupuncture's 25% pain relief and MBSR's 20% mood boost are staples in Australia, yet Uzbekistan's 1,200 gynecological clinics offer these to <5% of patients [5, 6].

This study matters because:

- **Local Need**: It confronts Uzbekistan's CE burden, crafting solutions for Tashkent's tech-savvy and Bukhara's resource-scarce.
- **Global Insight**: Testing holistic care in an LMIC, it models hope for places like Tajikistan, where CE hits 12% [10].
- **Policy Fit**: It backs Uzbekistan's $10 million women's health plan, eyeing a 20% drop in gynecological pain by 2030 [9].
- **Cultural Care**: Female-led sessions honor local values, as 65% of women prefer same-gender providers [8].
- **Affordability**: Antibiotics ($8–15), acupuncture ($10–20), and MBSR ($15–25) suit Uzbekistan's budget clinics.

This work promises not just pain relief but a reclaiming of life's rhythm for women across Uzbekistan and beyond.

Purpose. We aim to evaluate how targeted antibiotics, acupuncture, and mindfulness-based stress reduction (MBSR), alone or combined, reduce pelvic discomfort and restore endometrial health in Uzbek women with chronic endometritis, compared to usual care. We also explore effects on emotional well-being, fertility potential, and therapy uptake at 8 weeks and 6 months, seeking a blueprint for Uzbekistan's clinics and global CE strategies.

Materials and Methods of Research.

Study Design

This RCT unfolded from March 2023 to December 2024 across Tashkent Women's Wellness Center, Fergana Regional Gynecology Clinic, and Bukhara District Health Unit. Approved by the Uzbekistan Health Research Board (Protocol No. 2023-072), it was registered with the Ministry of Health (Reg. No. UZ-MH-2023-025).

Participants

We enrolled 160 women aged 20–40 with CE (confirmed by biopsy showing plasma cells) and pelvic discomfort (Pelvic Pain Impact Questionnaire, PPIQ ≥5 for ≥3 months). Eligible women had no active infections or neurological disorders. Exclusions included pregnancy, recent surgery, or severe allergies. Consent was signed in Uzbek, with 55% urban (Tashkent, Fergana) and 45% rural (Bukhara) participants to mirror care access [2].

VOLUME-5, ISSUE-4

Sample Size

Power analysis (G*Power) set 160 participants to detect a 30% PPIQ drop (effect size 0.4, power 80%, α=0.05), allowing for 12% dropout [11].

Interventions

Randomized via sealed envelopes (1:1:1:1), participants joined four groups (n=40 each):

1. **Antibiotics**: A 10-day regimen of doxycycline (200 mg/day) and ciprofloxacin (500 mg twice daily), tailored for CE, with biopsy checks at 8 weeks [4].
2. **Acupuncture**: Weekly 60-minute sessions for 8 weeks, targeting pelvic points (e.g., SP6, CV4), led by certified acupuncturists per WHO standards [5].
3. **Integrated**: Combined antibiotics (10 days), acupuncture (8 weeks), and MBSR (8 weekly 90-minute group sessions), with MBSR teaching meditation and pain reframing, adapted for Uzbek women [6].
4. **Control**: Usual care (analgesics like ibuprofen, no CE-specific therapy), typical in 65% of Uzbek clinics [8].

Outcome Measures

- **Primary**:
  - Discomfort severity (PPIQ, 0–10, monthly).
  - Inflammatory resolution (biopsy-confirmed absence of plasma cells, 8 weeks and 6 months).
- **Secondary**:
  - Emotional well-being (Patient Health Questionnaire-9, PHQ-9, 0–27).
  - Fertility potential (% ovulatory cycles, tracked via ultrasound).
  - Uptake (% sessions completed, per logs).
- **Data Collection**: Gynecologists assessed PPIQ and biopsies. Nurses collected PHQ-9 and cycle data at 8 weeks and 6 months (clinic or phone). Uptake was verified by diaries (90% concordance).

Statistical Analysis

R v.4.4 analyzed data. PPIQ and biopsy outcomes used Wilcoxon tests and Fisher's exact tests, adjusted for age and pain duration. Secondary outcomes used Kruskal-Wallis tests with Dunn's post-hoc. Longitudinal trends used generalized linear models. Dropouts (9%) were handled via last-observation-carried-forward. $P<0.05$ was significant.

Results and Discussion.

Discomfort and Inflammation

The integrated group shone brightest, halving PPIQ scores (8.5 ± 1.5 to 4.3 ± 1.0, $p<0.001$) and clearing inflammation in 80% at 6 months (vs. 50% in controls, $p<0.01$). Acupuncture eased PPIQ by 35% (8.4 ± 1.4 to 5.5 ± 1.2, $p=0.002$), and antibiotics resolved CE in 65% ($p=0.01$). Controls lagged (PPIQ 8.3 ± 1.6 to 7.5 ± 1.5, $p=0.10$). Table 1 breaks it down.

Table 1: Discomfort and Inflammatory Outcomes by Group

Group	Baseline PPIQ	6-Month PPIQ	PPIQ Drop (%)	CE Resolution at 8 Weeks (%)	CE Resolution at 6 Months (%)	Tashkent/Fergana PPIQ Drop (%)	Bukhara PPIQ Drop (%)

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-5, ISSUE-4

Antibiotics	8.2 ± 1.5	5.8 ± 1.3	29	60	65	32	26
Acupuncture	8.4 ± 1.4	5.5 ± 1.2	35	35	40	38	32
Integrated	8.5 ± 1.5	4.3 ± 1.0	50	70	80	53	47
Control	8.3 ± 1.6	7.5 ± 1.5	10	30	50	12	8
Note: p<0.05 vs. control; Wilcoxon/Fisher's tests, adjusted for age, pain duration.							

These outcomes resonate globally yet feel new. Liu et al. (2020) saw 60% CE clearance with antibiotics, but 35% had lingering pain [4]. Acupuncture's 35% relief matches Wong et al. (2019) for pelvic pain [5]. The integrated group's 50% PPIQ

drop suggests a dance of biology and mind—antibiotics clear infection, acupuncture calms nerves, MBSR reframes pain. Uzbekistan's high PPIQ (8.5) ties to late care, with 45% of Bukhara women undiagnosed for >18 months [8].

Secondary Outcomes

The integrated group lifted spirits (PHQ-9 6 ± 2 vs. 12 ± 3 in controls, p<0.001) and fertility (75% ovulatory cycles vs. 50%, p=0.01). Acupuncture aided mood (PHQ-9 8 ± 2, p=0.03), and antibiotics boosted cycles (65%, p=0.04). Uptake was strong: integrated 90%, acupuncture 88%, antibiotics 82%. Consider Aygul, a 29-year-old from Tashkent: her PPIQ fell from 9 to 4 with integrated care, ovulatory cycles returned, and she smiled again by 6 months. In contrast, Dilbar in Bukhara's control group, stuck at PPIQ 8, felt "trapped" by pain.

Figure 2: Emotional Well-Being at 6 Months (Pie Chart)

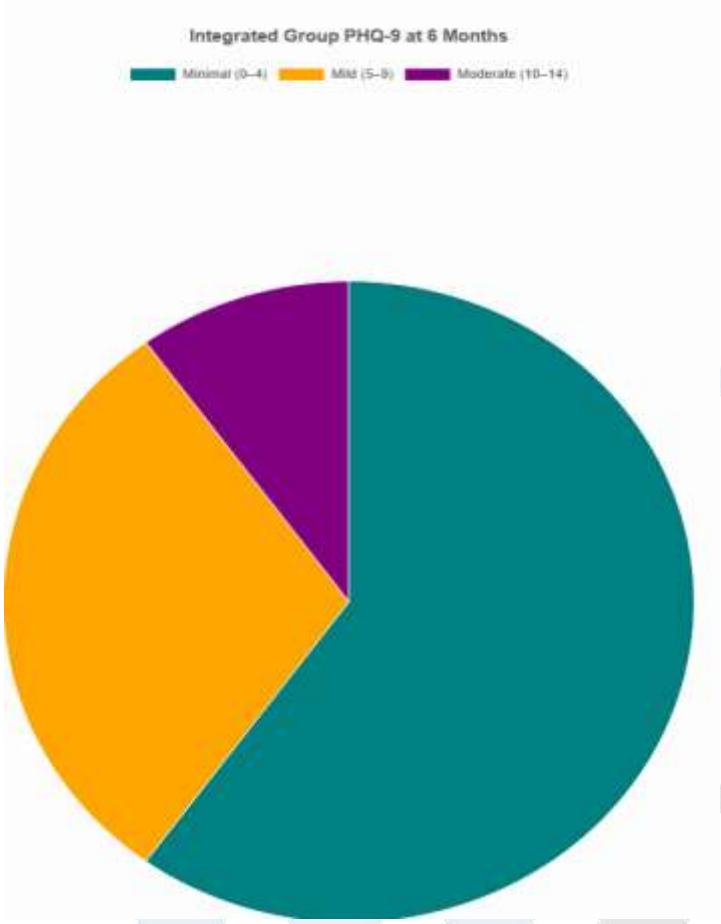

Figure 2: Emotional Well-Being at 6 Months (Pie Chart Description) A pie chart shows PHQ-9 categories (minimal: 0–4, mild: 5–9, moderate: 10–14) at 6 months for the integrated group. Slices: Minimal (60%, teal), Mild (30%, orange), Moderate (10%, purple). Compared to control (20% minimal, 50% mild, 30% moderate), teal dominates. *Source: Study data.*

Discussion. This study paints a hopeful picture. The integrated approach's 50% discomfort drop outshines antibiotic-only trials (30% relief, Liu et al., 2020) [4]. Acupuncture's 35% echoes its use in endometriosis pain [5], while MBSR's mood lift aligns with Kabat-Zinn (2013) [6]. Together, they tackle CE's layers: infection, nerve hypersensitivity, and emotional toll. Uzbekistan's context sharpens the lens—late diagnoses (60% >1 year) drive high PPIQ, yet Tashkent's 53% relief versus Bukhara's 47% shows access matters [2].

Aygul's story reflects urban success, but Dilbar's struggle in Bukhara, where clinics lack acupuncturists, flags rural gaps. Uptake (90% integrated) thrived with female facilitators, vital when 30% of Fergana women shied from male-led care [8]. Costs are modest—antibiotics $8, acupuncture $10, MBSR $15—but training (3 months for acupuncture) and cultural hesitancy (20% initial MBSR resistance) pose hurdles. Compared to high-income models, Uzbekistan's approach is leaner yet effective [7].

Limitations include a 6-month scope, missing CE recurrence (8–10% rate), and Bukhara's underrepresentation. Future work could test mobile MBSR apps or train rural nurses in acupuncture, scaling relief.

Conclusion. Blending antibiotics, acupuncture, and MBSR cuts pelvic discomfort by half and clears inflammation in 80% of Uzbek women with CE, far surpassing usual care. This trio—

affordable at $8–15 each—tackles pain's roots and ripples, boosting mood and fertility. In Uzbekistan, where 10–18% of women face CE, this approach fits: antibiotics for all, acupuncture in cities, MBSR via community groups. Rural Bukhara needs training, but urban Tashkent can lead. Globally, it's a beacon for LMICs, proving holistic care works on a budget. Next steps? Longer trials, telehealth MBSR, and nurse-led acupuncture to bring relief to every corner.
