GENERAL CHEMISTRY PROBLEMS OF MEDICAL STUDENTS AND STRATEGIES FOR THEIR SOLUTION

Abdullaeva Khafiza Davronovna, Khodjaniyazov Sherjon Bekboevich

Urgench branch of the Tashkent Medical Academy

Annotation

This article analyzes the main problems faced by medical students in studying chemistry and ways to overcome them. The study identifies such factors as difficulties in understanding abstract concepts, lack of mathematical training, lack of interdisciplinary connections, and ineffectiveness of teaching methods as the main obstacles. The necessity of a contextual approach to problem-solving, the use of active learning methods, digital technologies, increasing motivation, and developing the teacher's pedagogical competence is proposed. The article contains strategies formed on the basis of modern pedagogical approaches and substantiated by scientific research.

Keywords. Medical students, Chemistry, Pedagogical problems, Active learning methods, Problem-based learning (PBL), Motivation, Visual technologies, Pedagogical strategies, Interdisciplinary connections, Quality of medical education

Introduction

Medical education is based on important branches of modern science. One of them is the science of chemistry, which is the basis of such areas as biology, pharmacology, and physiology. Nevertheless, many medical students face challenges in understanding chemistry and applying it in practice. This situation can negatively affect not only the level of knowledge of students, but also their future professional activity.

Since chemistry includes many theoretical concepts, formulas, and abstract models, it creates a sense of learning difficulty for students. This, in turn, leads to a decrease in interest in lessons, passive participation, and low academic results. Therefore, the development of new pedagogical approaches, innovative methods, and strategies that encourage active participation of students in teaching chemistry is one of the urgent tasks.

This article analyzes the main problems faced by medical students and proposes effective strategies for their solution. The goal is to make chemistry more understandable, relevant, and practically significant for students.

Main Challenges Faced by Medical Students in Learning Chemistry

Although chemistry is very important for medical students, they face many difficulties in mastering it. Here are some of the most common problems:

Misunderstanding of abstract concepts

In chemistry, there are many invisible concepts, such as atomic, molecular, and electron orbits. Students have difficulty visualizing these concepts, especially if they are not sufficiently supported by visual materials. This hinders the deep formation of knowledge. [6]

Lack of mathematical training

In chemistry, many calculations are required - stoichiometry, concentration, pH level, gas laws, and so on. Many medical students struggle with concepts related to mathematics, which reduces their confidence. [1]

Lack of interdisciplinary connections

In many universities, chemistry is taught independently, in an isolated form. Knowledge not related to medicine reduces the student's interest in the lesson. If the learned chemical knowledge is not explained how it is applied in clinical practice, this discipline loses its significance.[2]

Lack of motivation and inner confidence

Thoughts like "I'm not suitable for this subject," "I can't handle chemistry" affect the student's self-esteem. Such internal conflicts reduce their active participation and make them passive learners.[9]

Incorrect teaching methods

The use of monological lectures based only on the textbook instead of active teaching methods leaves the student only in the listener's position. Without laboratory work or problem tasks, the learning process will be sluggish.[8]

Lack of teacher training and pedagogical approach

Being knowledgeable in every subject is not enough. It is also important that the teacher can communicate interactively with students, explain interdisciplinary connections, and apply modern methods.[5]

Having identified these problems, we move on to the next section - strategies for their elimination. These strategies cover everything from pedagogical approaches to the use of technologies.

Problem Solving Strategies (Proposed Strategies for Improvement)

The following pedagogical and technological strategies can be used to change the attitude of medical students towards chemistry and to achieve their deep understanding of the subject:

1. Contextualized Teaching

Teaching chemistry lessons in connection with real-life situations, especially clinical cases, reveals the importance of the subject for students. For example:

• "Blood pH Level and Acid-Base Balance"
• "The Role of Organic Substances in Medications"
• "Understanding Metabolism Through Chemical Reactions"

This approach enhances the student's professional motivation.[6]

2. Active Learning Methods

In contrast to traditional lectures, it is necessary to implement active teaching methods for students:

• Group discussions, interactive lessons
• Problem-Based Learning (PBL) - learning based on problem situations
• Case-study methods - based on topics such as pharmaceutical chemistry, metabolic syndrome

These methods foster a deeper understanding of knowledge, independent thinking, and practical reasoning.[3]

3. Digital Technologies and Visual Aids

In understanding chemistry, visualization and technological tools are very helpful:

• 3D molecular models, interactive simulations
• Online platforms: ChemCollective, Khan Academy, PhET Simulations
• Explaining molecular processes through short animations

This increases the rate of concept acquisition and retention among students.[2]

4. Assessment & Feedback

• Short tests and quizzes after each topic
• Reflective notes - "What did I understand today?," "Which aspect was difficult for me?"
• Frequently receiving feedback and advice from the teacher through exchanges of ideas[7]

VOLUME-5, ISSUE-4

5. Retraining of Teachers and Work on Methodology

• Training teachers in pedagogical techniques and communicative approaches

• Encouraging them to teach in collaboration with students: working as a "mentor" and a "coach"[5]

If these strategies are implemented in stages, medical students will be able to understand chemistry more deeply and apply it in practice.

Experiment and Research (Empirical Support)

The effectiveness of the above strategies has been proven not only theoretically but also practically. Scientific research conducted in various countries has shown the following results:

1. Effectiveness of Problem-Based Learning (PBL)

Studies conducted by Barrows (1986) and Schmidt et al. (2007) show that students who studied through the PBL approach:[3]

• Gain a deeper understanding of subjects

• Develop clinical thinking skills

• Acquire knowledge based on understanding, not memorization

This method yielded high results, especially in medical students.

2. Impact of Active Learning Methods

Overton & Randles (2015) showed that with the introduction of active learning methods in chemistry, student learning and interest increased by 25-40%. Especially effective were laboratory experiments and lessons based on real-life situations.[8]

3. Effects of Increasing Motivation

Based on the Self-Determination Theory developed by Ryan & Deci (2000):[9]

• Students are more motivated if they feel like important and active participants in the learning process

• This directly affects academic achievement

Cook & Artino (2016) applied these ideas to medical education, analyzing the role of student motivation in assessment.[7]

4. Impact of Visual Technologies and Digital Tools

An example of chemistry lessons where the "flipped classroom" model was introduced by Seery (2015):[2]

• Students who watched videos before class were more active during class

• With the help of visual aids, complex concepts (for example: molecular geometry) were much easier to master

5. Emotional Environment and the Role of the Teacher

Frenzel et al. (2009) note that the teacher's enthusiasm and energy for the lesson directly influences the student.[5] They:

• Foster a positive emotional attitude in the student

• Reduce anxiety and fear about the subject

These studies show how important it is not only what to teach but also how to teach chemistry. With the help of appropriate methods, even the most difficult subjects can become understandable and inspiring.

Conclusion

The difficulties encountered by medical students in mastering chemistry knowledge are multifaceted, and these problems depend not only on the content of the subject but also on the method of organizing the educational process. Although chemistry is an integral part of medical science, students often

consider it complex, irrelevant, and incomprehensible. This leads to a superficial formation of knowledge, a decrease in motivation, and an increase in passive students.

The scientific sources and research reviewed in this article show that these problems can be effectively addressed through changes in teaching methods, contextualization of educational material, and the application of active learning methods and visual technologies. In particular, chemistry lessons incorporating clinically relevant examples, methods requiring active student participation (such as PBL and case studies), and real-time feedback systems increase effectiveness. Therefore, the main recommendation for educators and educational institutions is to teach chemistry in a practical and life-relevant manner within the medical context, to foster emotional cooperation between teachers and students, and to create an environment that enables students to think independently. Only then will today's medical student - tomorrow's professional doctor - understand not only the theory of chemistry but also its practical significance.
