Annotation

The article analyses the role of investment resources in the development of manufacturing industry and their impact on economic efficiency. Attention is drawn to the strategic importance of investments in improving the competitiveness of industrial enterprises, modernisation of production facilities, introduction of new technologies, expansion of export potential. The results of the article substantiate the relevance of investment policy in ensuring sustainable development of industries.

Keywords: industry, enterprise, investment, production, digital economy, capital efficiency, capital intensity, export, import, economic development

Introduction: Uzbekistan's textile industry is one of the strategic sectors of the economy. is one of the most important in terms of export potential and job creation. Reforms in this sector have significantly increased investment activity in recent years. In recent years, the development of industry in Uzbekistan has become one of the priority areas of the state economic policy. During 2017-2023, industrial production grew steadily and its share in GDP is estimated at around 28-30 per cent. In particular, favourable conditions for foreign investors are being created. For example, many large investment projects are implemented through the free economic zones "Angren", "Navoi" and "Jizzak"[1] .

Literary review

[1] https://lex.uz/docs/-5841063

A. Kodirov and A. Abdullaev reviewed the theoretical foundations of investment activity, types of investment resources, mechanisms of their attraction and management. They also analysed in detail the role of capital investment in the development of industries .[2]

It is known that in order to attract investments into production and to use them effectively, it is necessary, first of all, to carefully analyse and correctly direct the investment resources attracted by the enterprise.

M.M.Mahkamov, B.S.Salomov in the work "Organisation and Management of Investment Activity" considered investment processes in the production sphere, their economic efficiency, risk management methods. In particular, the role of investment resources in modernisation and technological renewal of industrial enterprises is covered in detail .[3]

Also Russian scientist S.Y. Glazyev in his research speaks about stabilisation of the national economy through strategic development of industry, attraction of innovations and investments[4] . These ideas can serve as a theoretical basis for the development of investment policy in industrial sectors. In addition to the above- mentioned points, Sh. Halimov in his work "Economy of Industry" expressed the following thoughts on the importance of investment. Information is available on the

economic fundamentals of manufacturing industry, efficiency indicators and resource efficiency. This book is directly related to your topic .[5]

Main part: The efficient operation of industrial enterprises in the region contributes not only to the sustainable development of the manufacturing industry, but also to the social progress of society. There is a high potential for job creation through the efficient utilisation of available material resources through the development of manufacturing industry. The development of manufacturing industry is also important for maintaining the balance between exports and imports of goods within the country. Therefore, attention to the manufacturing industry is

increasing every year, even at the regional level. World experience shows that the role of investment in the development of manufacturing enterprises is invaluable. Therefore, in recent years, the attraction of investment resources to the industry has been carried out on the basis of presidential decrees, state programmes and international partnerships.

In particular, 2023, the total volume of investment will exceed 325 trillion soums, of which the share of foreign direct investment will be about 20 per cent. It is known that the efficiency of foreign investment is higher than other sources of investment. In recent years, 40 per cent of investments attracted to industrial sectors have been directly directed to the renewal of production capacities and the purchase of technological equipment. At the same time, due to the political processes taking place in the country, projects such as "Regional Industrial Clusters" and "Innovative Technoparks" have been launched in many regions and are now functioning intensively. As a result, a number of incentives have been created for local and foreign investors

In particular, in accordance with the Law of the Republic of Uzbekistan No. O'RQ-598 dated 25 December 2019, the state support of investments and investment activity in the country is carried out in order to create a favourable investment climate, stimulate investments in the organisation of new competitive and innovative, export-oriented and (or) import-substituting productions, expansion and renewal of existing productions using modern technologies and introduction of modern management experience. The state support of investments and investment activities is carried out by the following methods:

- application of benefits and preferences;
- allocation of centralised investments for co-financing of the investment project;
- financial, advisory and information support .[6]

Political reforms and socio-economic processes carried out by the state are among the most important factors for any type of investor. The high or low

investment attractiveness of a region is inextricably linked to the reforms carried out in it.

In particular, for the textile industry operating in the country, more than 100 textile enterprises will be established in 2022-2024 in co-operation with many investors from China, Turkey and South Korea, advanced economies. As a result, the export potential of textile enterprises has reached $3 billion in recent years.

The construction materials industry has also attracted large investments and positive work is being done here. For example, in Karakalpakstan, Jizzak and Navoi oblasts, clusters for the production of cement, plasterboard and metal products have been created jointly with foreign investors. The population of the country is growing every year, increasing the population's need for energy. In order to provide the population with clean and environmentally friendly energy, the country needs to attract and effectively utilise investments in energy and "green industries", production of equipment supporting solar and wind energy.

The above-mentioned changes and reforms are also being implemented on a large scale in Andijan province.

For example, the scale of investment in manufacturing has increased in recent years. (See Figure 1)

	2014	2017	2020	2022	2024
%	18.5	26.1	36.5	48.3	52.3

Figure 2.2.1 Share of investments directed to manufacturing industry from investments attracted to fixed capital in Andijan region .[7]

The above information reflects the degree of creation of conditions for the development of manufacturing industry in Andijan province in recent years and changes in the scale of investment. Specifically, in 2014, the manufacturing sector accounted for 18.5 per cent of fixed capital investment; in 2017, the figure exceeded 26.1 per cent; by 2020, it was

36.5 per cent; by 2022, 48.3 per cent; and by 2024, 52.3 per cent of total fixed capital investment.

In particular, by attracting investment to the region, infrastructure and information services were developed along with GRP. The current era of economic development is the era of direct information.

The increase in the share of the processing industry was facilitated by modernisation and diversification of the leading branches of the manufacturing industry, introduction of modern technologies for processing raw materials and semi-finished products, targeted support for industries

that are highly competitive in the global market, and an increase in the share of the processing industry in the structure of production.

In addition, computerisation of production in the information age will affect industrial sectors to produce faster and better quality products in the future. It is known that most industrialised countries use digital technologies in production. Digitalisation of production processes is necessary to effectively utilise the investments attracted to the region and increase their efficiency. It is necessary to further expand the use of new technologies at industrial enterprises. Attracting investments in production enterprises will increase the possibilities of renewing the existing material and technical base of the company. This, in turn, directly affects the quality of products manufactured at the enterprise. This will not only increase the scale of production, but also accelerate the process of diversification of the enterprise.

---

[7] The author's work is based on data from https://andstat.uz/uz/

Further expansion and increase in production capacity at industrial enterprises, in turn, increases the enterprise's need for additional equipment, raw materials and labour. Attracting investment into the enterprise will help to eliminate such problems.

It is known that there is a constant competitive environment between enterprises producing similar products. Enterprises that have established a systematic and efficient use of investments have increased chances to win the competition both in the domestic and foreign markets.

Conclusion:

In recent years, the development of manufacturing industry in the country has increased significantly. The role of investment resources in manufacturing processes is important. It also contributes to improving the quality and competitiveness of products by improving production methods and technologies, creating innovative production facilities, introducing modern equipment and digital technologies.

In particular, new production capacities are being created on the basis of foreign and local investments in such sectors as heavy industry, automotive, textile and food processing. At the same time, there is still a need to address existing problems in the country, such as improving the investment climate, attracting investment in small and medium-sized businesses, and developing infrastructure.

Suggestions:

- Improvement of the investment climate: it is necessary to create favourable conditions for investment at the state level, provide tax incentives, and introduce simplified procedures for granting land plots.
- Support for local investors: It is recommended to expand the scope of state grants, credit incentives and counselling services for local entrepreneurs operating in Andijan Oblast.
- Diversification of industries: it is important to attract investments not only in traditional industrial sectors, but also in areas of production of innovative products with high added value.
- Improving human resources potential: Successful implementation of investment projects requires training qualified personnel, strengthening interaction between technical schools and universities and production enterprises.
- Regional infrastructure development: It is recommended to create attractive conditions

for investors by upgrading industrial zones, logistics centres, energy and water supply systems.

The biggest problem faced by many countries in the current global economic crisis is the growing unemployment rate. To prevent unemployment, it is necessary first of all to increase the scientific potential of the region's population and to increase the number of manufacturing enterprises by attracting investments to the region.

The State also needs to create incentives to ensure that investment is utilised effectively and further scaled up.
