Abstract: In this article, the use of blockchain technologies and decentralized financial instruments creates new opportunities and threats for traditional financial markets. The impact of cryptocurrencies on the modern monetary system is considered, the risks and benefits of economic processes are determined, and the trends and challenges faced by the traditional financial system in the era of cryptocurrency are analyzed.

Key words: digital technology, blockchain technology, lending, investments, assets, cryptocurrencies, virtual currencies, central banking, DeFi, inflation.

Абстрактный: В данной статье использование технологий блокчейн и децентрализованных финансовых инструментов создает новые возможности и угрозы для традиционных финансовых рынков, рассматривается влияние криптовалют на современную финансовую систему, определяются риски и выгоды экономических процессов, а также анализируются тенденции и проблемы, с которыми сталкивается традиционная финансовая система в эпоху криптовалют.

Ключевые слова: цифровые технологии, технология блокчейна, кредитование, инвестиции, активы, криптовалюты, виртуальные валюты, центральный банк, DeFi, инфляция.

INTRODUCTION

In recent years, the rapid development of digital technologies has caused fundamental changes in the financial system. In particular, blockchain technology and digital currencies based on it are reshaping the global financial architecture. These technologies are creating new opportunities not only in payment systems but also in lending, investments, and asset management. At the same time, they also pose new risks and regulatory challenges.

The concept of blockchain (visual blockchain chain of blocks) is a continuous series of blocks of information, i.e., a chain of information about transactions, transactions, and contracts within the system, expressed in cryptographic form. The blockchain not only needs to digitize the communication between blocks, but also edit all subsequent blocks to change the information in each block (Figure 1).

Digital currency is a form of currency that is stored, transmitted, and circulated in computer systems, particularly via the Internet, and does not have a physical form. Digital currencies include cryptocurrencies, virtual currencies, and central bank digital currencies (CBDCs). Although they have similar features to traditional currencies, they exist only in digital form, allowing for fast and efficient online transactions.

In the decision PQ-3832 of the President of the Republic of Uzbekistan Sh. Mirziyoyev "On measures for the development of the digital economy in the Republic of Uzbekistan", "The comprehensive development of cooperation with international and foreign organizations in the field of activity on crypto-assets and blockchain technologies, the involvement of highly qualified foreign experts working in the field of development of blockchain technologies for the joint implementation

of projects in the digital economy, and taking into account the advanced experience of foreign countries It is not for nothing that he specifically emphasized the need to "create the necessary legal framework for the introduction of blockchain technologies"[1].

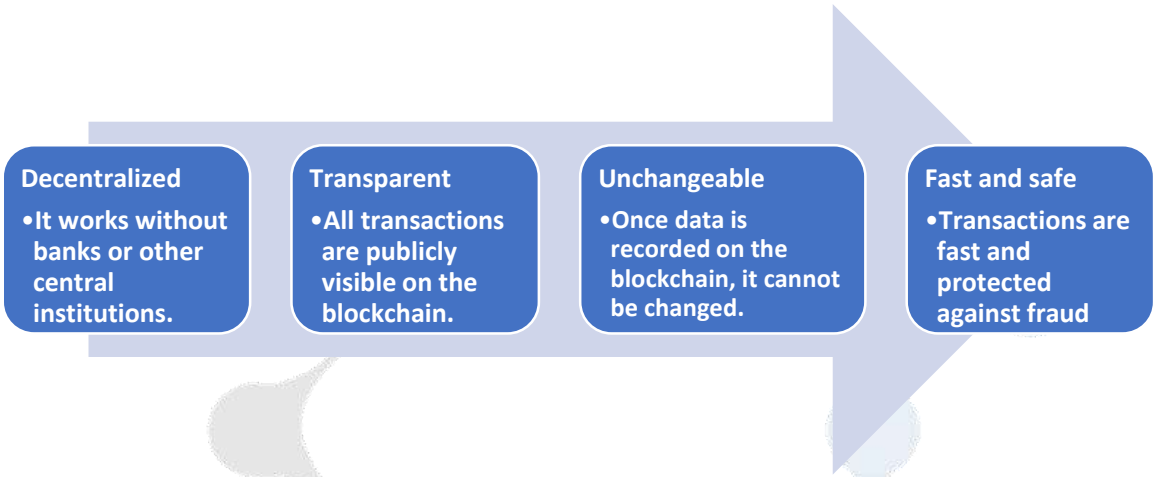

Figure 1. Main features of blockchain.

Many achievements have been achieved through the development of blockchain technology and its widespread promotion in the economy. One of the main ones is the achievement of money transfers. Today, blockchain technology is changing financial systems and creating new opportunities. For example, banks, trading platforms, and even governments are seeking to develop digital financial systems based on blockchain.

Analysis and results:

With the help of digital currencies based on blockchain technologies, the money supply has been controlled, the level of liquidity has been increased, and the possibilities of implementing monetary policy in the short term have been significantly expanded. At the same time, we need to pay special attention to issues of cyber security and economic security through the system of digital currencies. Digital currencies, especially cryptocurrencies, have emerged as one of the most important innovations in finance in the last decade. As a prime example of this, since the creation of Bitcoin in 2009, the number and variety of digital currencies has increased significantly. They are now recognized not only as a new means of payment but also as a factor that seriously affects the traditional financial system.

With the adoption of blockchain by banking systems, banking services have become faster and cheaper without intermediaries, projects such as XRP and Stellar have made global transactions faster and cheaper, and financial services have become much easier.

Crypto-assets and tokenization through blockchain are fundamentally changing financial markets, creating new opportunities for investors. Tesla and Apple are launching blockchain-based tokens of their digital stocks. Tokenized properties - Real estate, gold and other assets are starting to be sold in token form. DeFi enables income through loans, liquidity pools, and tokens. Central banks are developing digital currencies based on blockchain. Blockchain technology makes payment systems fast, secure and cheap. As a result, Bitcoin transactions will accelerate, global payments will be made without banks, and the digital payment ecosystem will develop.

Blockchain payment systems are becoming a strong competitor to traditional banking systems. Blockchain technology is expected to develop in the following main directions in the coming years:

- Tokenized assets – Shares, real estate, and gold are tokenized.
- Development of CBDC – Digital currencies of central banks will develop.
- Blockchain and AI integration – Artificial intelligence optimizes blockchain networks.
- Crypto and Real Sector Collaboration – Corporations are incorporating cryptocurrencies into their systems.

Digital currencies and blockchain technology have the potential to fundamentally change the financial system. Through these technologies, the speed, security, and transparency of transactions will increase significantly. It is worth mentioning that one of the main factors that helped to increase the popularity of cryptocurrency is the significantly lower transaction costs and higher payment speed (Table 1). At the same time, the low level of understanding of legislation, blockchain technology, digital currencies, and technology creates certain challenges in the level of security of global financial cyber-attacks and digital payment systems. If the level of security is low, it reduces the trust in the system of digital currencies. Also, technological infrastructure and security issues are important for the effective operation of digital currencies. Digital currencies create opportunities for the Central Bank of the Republic of Uzbekistan to manage monetary policy more efficiently.

Table 1. Comparison of transaction costs

Payment system	Transaction type	Expenses (%)	Transfer time
Bank transfer	International	2-5%	1-5 day
Payment systems (PayPal, Western Union)	International	4-10%	1-2 day
Bitcoin (BTC)	International	0,2-1%	10-30 minute
Ethereum (ETH)	International	0.1-0.5%	1-3 minute

Conclusion:

In conclusion, blockchain technology is the main technological foundation of digital currencies. The integration of blockchain and digital currencies into the financial system plays an important role in the transition of the global economy to a new stage. They facilitate access to financial services, reduce costs, and build reliable systems. The future success of these technologies will depend on their proper regulation and level of global cooperation.

Expected results in controlling inflation, promoting international trade, increasing liquidity, and expanding financial inclusion, the introduction of digital currencies has a positive effect on the economic system of Uzbekistan. But to achieve these results and successfully introduce digital currencies, the Central Bank needs to take modern security measures. For example, in the introduction of digital currencies, it is necessary to develop the technological infrastructure, strengthen security measures, and coordinate all links of the financial system. At the same time, it is important to study and adapt international experiences and increase the financial literacy of the population. By solving these problems, blockchain-based financial systems are expected to become more popular in the future.

The results of the analysis show that the introduction of digital currencies requires the integrity and security of the technological infrastructure. It is possible to invest in the most promising projects by monitoring the changes in the blockchain market.
