Abstract: This article explores how the concept of time is expressed through proverbs and idioms in Uzbek and English,analyzing the meaning and nuances conveyed through these expressions. The study also focuses on revealing the time concept and conducts comparative analyses to examine how it is represented through various linguistic units in different languages.

Key words: time, expressions, time of the day, lexemes, folklore.

It is well known that before the invention of the clock, humanity relied on the movement of the sun to determine time, and the device that determined time in this way was called a sundial. At the same time, as a result of intellectual development, water and hourglasses were also invented, and time was determined by them. Time was measured not in exact seconds, but in expressions related to the way of life of the people. The study of chrononyms that unite within the framework of this concept of "time" within the framework of linguistics allows us to reveal historical and geographical facts, as well as to develop concepts about the cultural, social and political essence of the era in which they were created. In recent years, research on the study of concepts has been increasing in world linguistics. In such studies, special attention is paid to concepts that express specific concepts, including abstract concepts such as "Duty", "Faith", "Honesty", "Time". After all, there are also peculiarities in the concepts about specific realities that are directly observed for people of all nationalities. However, it is known that concepts that express abstract essences that are not directly observed, but only perceived, are unique to each nation. From this point of view, the study of the concept of "Time" is also important, and its linguistic realization has a similar and different structure in different languages. In all nations, "Time" indicators are expressed through units formed on the basis of the values and religious worldview of this nation and are distinguished from each other. In particular, in the comparative-cultural analysis of chrononyms in the English and Uzbek lexicons, the main factor can be considered as different concepts and the ethnic worldview unique to the nation. Chrononyms also express values that change depending on history. In this case, chrononyms, along with expressing the concept of "Time", also serve to show the specific socio-political realities of the era. Also, socio-political realities specific to each period lead to the transformation of the lexical structure of chrononyms. Therefore, chrononyms expressed by a lexeme in a certain period can be used in the form of word combinations and phraseologisms in another period. For example, the Uzbek people call the transition from winter to spring with the expression "Ilik uzildi". This unit is also used in the "Explanatory Dictionary of the Uzbek Language" in the form of iliguzildi [11, 192], and as a "time" unit expressing the first months of spring, it is joining the ranks of inactive units in the speech process. This unit, which is understandable mainly to representatives of the elderly population, is being influenced by socio-economic development.

Chrononyms, in addition to general speech, are formed in relation to a specific field or situation, serve to indicate the characteristics of this field and are used within this field/situation.

Therefore, their use and semantic development are constantly dependent on the field. For example, the field of education is divided into several stages, and in school education the term "holiday" is a term used to describe the weekends between the terms of November, December, March and the period from May 25 to September. In schools in England, holidays are usually divided into the following main periods. The dates of these holidays may vary slightly each year and may also differ depending on the region (for example, in England, Wales, Scotland, and Northern Ireland). But in general, they are as follows:

Autumn half term. Time: Late October (usually two weeks)

Christmas holiday. Time: Late December to early January. Duration: 2 weeks.

Spring half term. Date: Mid-February. Duration: 1 week.

Easter holiday Date: Late March or early April (varies depending on Easter). Duration: 2 weeks.

Summer half term Date: Late May to early June. Duration: 1 week.

Summer holiday Date: Late June to early September. Duration: 6 weeks (sometimes longer).

The ethnic worldview of the people is important in the formation of chrononyms, because the linguistic picture of the world depends on which part of it the people want to see and name. Just as in the dark, only the part of the world that the people pay attention to is visible, so only that part of the world that the people pay attention to is named. For example, in the Uzbek language, the day is divided into parts such as day, night, dawn, dawn, morning, breakfast, lunch, noon, noon, afternoon, evening, evening, prayer, evening, dinner, night. Among the examples given, one can see that the noon lexeme, which expresses the times of prayer, formed on the basis of the religious worldview of the Uzbek people, is used as one of the parts of the day. In English, the “lunch” lexeme is actively used to express this part of the day, and is a chrononym formed on the basis of the time of eating, like the lunch lexeme in the Uzbek lexicon. In the Uzbek language, there is a possibility to express the time of day from sunrise to morning through several units. For example, tong, adhan, sahar, sahar-mardon, bomdod, subh, subhidam, mardon, tongotar. Although these chronologies are used for the same time of day, there is a difference between them in terms of time standards. The early awakening of the Uzbek people from early morning through the members of this synonymous series, located in one synonymous series, expresses the very early beginning of life in a broad sense. Among the samples of Uzbek folk oral creativity, one can also find linguistic and cultural units formed with the participation of these chronologies. For example,

Early riser ish bidirir, late riser köp turtinar.

Early riser ish horimas.

Morning time is a mere happiness.

Morning work, makes the heart happy.

Now let's look at how such lexemes and proverbs are expressed in English. There are proverbs in English about getting up early, similar to Uzbek proverbs. For example,

“The early bird catches the worn” – “to achieve success, you need to get up early”;

“Better late than never” – doing something late is better than not doing it at all [12, 263]. This proverb is semantically close to the Uzbek proverb “Better late than never” and tells the listener that he should do what he is doing, even if it is late.

In addition, we can cite the English units that express the parts of the day mentioned above:

Morning – morning, the period from sunrise to noon;

Afternoon – the period from noon to late;

VOLUME-5, ISSUE-4

Evening – the period from noon to late;
Night – the period from sunset to sunrise;
Midnight – 12:00 midnight;
Noon – noon, the middle of the day 12:00;
Sunrise – the time of sunrise at the beginning of the day;
Sunset – a unit denoting the sunset, the beginning of the night.
In addition to the units denoting “Time” in this lexeme form, examples of expressions can be given:
Early bird – an early bird: a person who wakes up early in the morning and begins his activity;
Daylight – daylight: natural daylight, usually used to express the time after sunrise and before sunset;
Highnoon – 12:00 noon. This expression in English is often associated with the time of a conflict or a conflict that is being resolved.
Dawn – the time of day when light first appears, before sunrise.
Dusk – the time of day after sunset, when the light fades.
Daybreak – the first beginning of the day.
Broad daylight – the time of day when the sun is high and it is completely bright.
Golden hour – the time of day when the sun is at its highest.
These words semantically correspond to the units (prayer times) formed on the basis of religious values in the Uzbek lexicon and serve to describe the day at this time or to express it through the movements of the sun.
Scholars have attempted to understand the relationship in the field of language and culture by conducting a comparative-cultural analysis of chrononyms in English and Uzbek. In particular, Alisher Navoi, Mirzo Ulugbek, Abu Rayhon Beruni and others have analyzed the historical, social and cultural approach to the Uzbek language. Their historical manuscripts contain theoretical information on how words denoting the concept of time appeared, where, when, and in what cases they were used. For example, the lexeme subhidam, meaning "Tongotar", arose from the combination of the lexemes dam, meaning "dawn" in Arabic, and "Payt" in Tajik. In this regard, the word was also used in one of Alisher Navoi's ghazals.
Kor'ganimdur subhning pirohanidin chokrok,
Kirpikin shanbnam to'kulgan sabzadin namroknok.

In this verse, the poet describes the morning, seeing Subh's prihan (clothes) torn, and dew dripping from his eyelashes. In this way, Navoi used the word "Subh" in many cases [13, 689]. We see that in this sentence, written in the old Uzbek literary language, the lexeme subhidam expressed the meanings of "early dawn", "time of dawn". Performing similar analyses within the lexical level of the English language, comparing the ethnological characteristics of the chrononyms of the two languages, allows us to show and substantiate their common and specific features. Conducting a comparative and cultural analysis of the lexemes used by English writers and formed over the years, and assimilated into the English language as a result of invasions and migrations, allows us to determine whether they are equivalent to the units of expression "time" that are used in the Uzbek language or were used in a certain period. For example, the lexeme dawn in the Old English lexicon is dagung, dagian - "to be day"; in Proto-Germanic dagaz - "day"; from the root pie agh - "a day". According to some assumptions, it appeared under the influence of relatives of the Scandinavian peoples (in Danish - dagning, Old Norse - dagan - means "dawn") and was used in the form of dawned "dawning".

Comparative-cultural analysis of chrononyms used in English and Uzbek helps to understand their meanings and forms of use, as well as relations in the field of language and culture.
