Abstract: The article presents the materials of sociological research conducted on a contingent of students of the military faculty, aimed at improving the system of training specialists in pre-conscription military education for general secondary schools and academic lyceums.

Keywords: education, monitoring, innovative activity, experimental research, motor training, pedagogical experiment, satisfaction index, questionnaire.

Introduction. At present, each country's military has its own unique features when it comes to preparing its armed forces. The issues in each country cannot be resolved without analyzing the work being carried out in the direction of developing and creating a military training system for future military personnel by other countries' armies.

In this context, President Sh.M. Mirziyoyev, in his speech titled “Our Armed Forces are the strong guarantee of the stability and progress of our country,” emphasized that, "The old approaches in organizing the educational process in academies have not yet been eliminated. Such a situation cannot be compromised. We must always move forward together with time, and if necessary, lead ahead of time. In academies and other military educational institutions, modern conditions have not been created to the required level. On the contrary, our cadets and listeners must acquire the most advanced and innovative knowledge and skills in the field of education. This is our main goal" [1].

To solve the tasks aimed at shaping the necessary knowledge and skills for a future military specialist, it is important to monitor and model the process of professional formation and development of the specialist through innovative activities. This can be achieved by preparing educators for innovative activities through systematic and creative approaches [2,5,9].

Analysis of Literature. According to the renowned scholar L.P. Matveyev, in the physical education program, “the obligatory topic of the educational process

is conducting theoretical classes on 'The professional and practical physical training of students,'" which is focused on practical skills development [6].

SH. X. Khankeldiev emphasizes the necessity of taking into account climatic conditions when planning the professional physical preparation of students [7].

I.L. Veselova noted that the nature of professional activity in recent years has undergone significant changes. These changes are related to reemployment and social progress in the fields of science and technology [8].

A.A. Belkin and A.M. Rakhmatov studied how to improve the effectiveness of special professional physical preparation in the 3rd and 4th stages, concluding that these topics must be included in the educational curriculum [3].

A.A. Kochkarov, in his dissertation on "The Pedagogical Technology of Professional – Practical Physical Preparation for Senior Cadets," presents a block-modular training system, which includes various stages such as the development of endurance, strength, speed, coordination, and professional skills [2].

O.X. Abdalimov, in his dissertation on "The Methodology of Professional Practical Physical Training in Specialized Educational Institutions," outlined various stages of training such as basic physical preparation, targeted physical training, and the effective use of physical preparation [5].

METHODOLOGY AND PRINCIPLES OF PHYSICAL TRAINING

The quality of the educational-pedagogical process is determined by the basic guiding principles of teaching, which form the scientific-pedagogical foundation of the educational process. These principles are dependent on the extent to which the underlying didactic principles are taken into account.

The most important didactic principles accepted in the system of physical education and professional military physical preparation in our country are as follows: ideological and scientific basis, specialized professional-applied orientation, consistency, visuality, awareness and activity, ease, and optimality.

The principle of ideological and scientific basis in teaching involves organizing the study material in a way that promotes teamwork, mutual support, and cooperation, ensuring it is aligned with the pressing issues facing the country. In the context of physical training exercises, this principle emphasizes explaining the importance of the movements studied for military readiness and incorporating physical and moral qualities necessary for training.

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,
2023-5.384 ResearchBib IF: 9.948 / 2024

The principle of specialized professional-applied orientation is closely connected with the previous principle. It ensures that the content of the training is relevant for professional military readiness, particularly for those preparing to serve in the armed forces, with a focus on increasing their readiness levels.

The principle of consistency ensures the continuous and systematic nature of the educational process. The fulfillment of pedagogical tasks requires a gradual and incremental approach to mastering skills and knowledge. This principle is based on the consistent mastering of the study material, moving from easy to difficult, from simple to complex, and from familiar to unfamiliar.

The principle of visuality emphasizes the importance of demonstrating new practical exercises, as the better a student understands and internalizes the movements, the more effective their learning will be. The analysis of their own actions and the identification and correction of mistakes is crucial for developing a solid technique.

The principle of ease focuses on adjusting the teaching and training process to the individual capabilities of the students, ensuring they can effectively handle the load, with gradual increments.

The principle of optimality involves ensuring the efficiency of physical training, aligning the development of skills and qualities with the required level of military readiness. It emphasizes that there is no need to overdevelop all qualities to their maximum, as the focus should be on meeting specific military duties and readiness levels.

At this stage, the teacher’s role in innovation becomes significant in ensuring that these pedagogical principles are applied systematically. The teacher's approach is shaped by their perspective on innovations and their ability to adapt these methods effectively.

The diagnostic-design phase focuses on preparing future teachers for the tasks of physical training, determining objectives and goals, creating conditions for pedagogical activities, and choosing appropriate methods and techniques for development.

The shaping phase is essential, as it sets the foundation for the physical readiness of future teachers. The primary goal of this phase is to develop their ability to plan and organize physical training exercises effectively.

The achievement of various levels of learning outcomes (reproductive, productive, and creative) in students is critical. These stages are developed through tasks that require analysis and mastery of relevant skills and are reinforced by real-life activities where future officers get familiar with the practical work of officers in the Armed Forces.

Evaluation-Correction Phase. The evaluation-correction phase is dedicated to analyzing the results achieved in shaping the readiness for military training and preparing for the future military service. This phase focuses on analyzing the results and fostering independent analysis.

The results of the analysis conducted at the Faculty of Military Education of Fergana State University confirmed the high efficiency of the structural-functional model in shaping the readiness of future specialists for military service. The results of sociological research conducted are presented in Table 1.

When asked, *"What innovations have occurred in the national education system since our country gained independence?"*, many responses indicated that the introduction of innovative technologies into the educational process and the establishment of new types of general education schools with modern sports facilities were among the key changes. Regarding the sources of information on innovations in the educational process, a significant portion of responses pointed to the following: the introduction of innovative technologies into the educational process (65.5%), master classes conducted by highly qualified teachers at specialized faculties (21.4%), open lessons and regular consultations in both theoretical and practical directions (7.5%), and a small percentage (4.4%) had access to scientific and methodological literature related to innovative technologies, indicating a lower level of their theoretical readiness.

of the interview challenging to grasp. Their responses mostly focused on listing the types of innovative technologies rather than addressing the broader changes in methodology itself.

A significant portion of the respondents emphasized the necessity of widespread implementation of pedagogical innovations in the field of physical culture and sports. Furthermore, when asked, *"What is the purpose of introducing new innovative technologies in your professional activity?"*, the majority of responses (49%) focused on *"diversifying and improving their work,"* followed by 27% who said the goal was *"to make their work more engaging and effective."*

Some students mentioned that their motivation for embracing innovation was tied to career advancement and material interests. From the interviews with graduates, it became clear that many had come to understand the necessity of using innovative technologies in their daily work and considered it important to apply these methods regularly.

To assess the readiness of students to implement innovations in the training process, two questions were posed during the research: *"Do you consider it necessary to introduce innovative pedagogical technologies into the teaching and training process?"* and *"Do you feel adequately prepared to engage in innovative practices?"* The majority of the students (63.7%) expressed the belief that such innovations were necessary in both school teaching and training activities in sports schools.

Table 2

Results of Questionnaire Responses Regarding the Implementation of Innovative Technologies in the Educational-Training Process of Graduating Students from the Military Education Faculty

Answers / Questions	"yes"	"no" According to this, it is closer to 'yes	It is closer to 'no' than 'yes	no	They are struggling to answer

the educational-training process?					
Do you consider yourself prepared for practical innovative activities?	16,5	29,7	32,4	14,9	6,5

The experimental data analysis reveals that future specialists, during their time at university, showed low levels of both theoretical and practical preparedness, especially in terms of their readiness to incorporate innovative technologies into their future professional activities. This finding suggests a gap in their readiness to apply such innovations, highlighting the need for more focused training in this area during their education (as seen in Table 4.2).

Furthermore, the sociological research conducted to assess the pedagogical activity experience in the system of public education showed significant findings. It was found that specialists with less than one year of professional experience exhibited the lowest satisfaction with the introduction of innovative technologies. This was attributed to the lack of sufficient training and experience in pedagogical activities. In particular, their preparation for incorporating innovative technologies was not at an adequate level, which affected their confidence and effectiveness in the field.

Table 3

Satisfaction Index Regarding Innovative Pedagogical Activities in the Public Education System Based on Higher Education Preparedness

the work experience	1 year or less	Up to 5 years	5 to 10 years	More than 10 years	$\bar{X}\pm\sigma$
U	0,36	0,68	0,54	0,72	0,58±0,21

U	0,36	0,68	0,54	0,72	0,58±0,21

Conclusion

The results of the survey highlight that a significant portion of the specialists studied recognize the necessity of incorporating innovative pedagogical technologies. However, their theoretical and methodological training is not yet up to the level required by modern demands.

2023-5.384 ResearchBib IF: 9.948 / 2024

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-5, ISSUE-4

For specialists with a pedagogical experience of up to 5 years, the satisfaction index showed a notable increase (0.68), which correlates with the end of their initial adaptation phase to the profession. However, specialists with a pedagogical experience between 5 to 10 years showed a slight decrease in their satisfaction index (0.54). This drop suggests the need for additional support in improving their professional skills, possibly through planned attestation and further professional development.

In contrast, specialists with over 10 years of pedagogical experience showed the highest satisfaction index (0.72). This is likely due to the accumulation of methodological experience over time, which positively impacts their ability to apply innovative pedagogical technologies effectively.

The results point out that the majority of the specialists surveyed recognize the importance of implementing innovative pedagogical technologies in their professional activities. Nevertheless, their theoretical and methodological preparedness does not fully align with the current demands of the field.

It is recommended that higher education institutions, particularly those that prepare highly qualified specialists, incorporate more targeted pedagogical adjustments into their curricula. This should involve improving the readiness of specialists for innovation and modernizing the training system to ensure it meets the demands of contemporary pedagogical and technological advancements.

Recommendations for Further Improvement:

Strengthen the curriculum of higher education institutions to better equip future specialists with both theoretical and practical skills in innovative pedagogical technologies.

Implement regular professional development and attestation programs for educators, especially those in the 5 to 10 years of experience bracket, to boost their skills in applying modern pedagogical practices.

Continue developing systems that allow for the continuous accumulation of methodological and innovative experiences among educators, particularly those with over 10 years of experience.

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-5, ISSUE-4

Incorporating these recommendations will contribute to the advancement of the quality of education and ensure that specialists are well-prepared to implement innovative technologies in their future pedagogical practices.
