dilnozashermuxamatova@gmail.com

**Abstract:**
This article explores the most effective methods for learning German grammar based on the results of a student-conducted survey. The data shows that classroom learning is the most preferred method, followed by language learning apps and online lessons. Self-study and speaking with native speakers were less popular. The article discusses possible reasons behind these preferences and highlights the importance of combining traditional and modern learning tools. Overall, the findings provide useful insights for language learners and educators aiming to improve grammar instruction strategies.
**Key words:** German grammar, effective methods, instruction strategies, language learners, interactive methods.

## Introduction.

Learning the German language opens doors to a rich cultural heritage, global career opportunities, and deeper connections across Europe. However, one of the biggest challenges faced by language learners is mastering German grammar. With its four-case system, complex sentence structures, and gendered nouns and articles, German grammar can often feel overwhelming—especially for beginners. Many students struggle to make sense of when to use der, die, or das, or how to position verbs correctly in subordinate clauses. Despite these difficulties, grammar is a core element of language learning that lays the foundation for effective communication. Fortunately, there are many proven methods and approaches that can make the process of learning German grammar more manageable and even enjoyable. From traditional techniques like grammar translation to modern, interactive methods involving technology and immersion, learners today have more tools than ever at their disposal. This article explores the most effective methods of learning German grammar, offering practical tips and strategies to help language learners build confidence, accuracy, and fluency.

## Literature Review.

Linguists and language specialists have long been interested in the German language because of its intricate and highly ordered grammatical structure. Its complex interactions between morphology, syntax, and phonology provide a wealth of opportunities for scholarly research and advance our knowledge of language evolution and acquisition. German grammar is unique among languages in the world for its linguistic beauty and educational obstacles, especially because of its strong inflectional system, changeable word order, and subtle use of grammatical cases.

A comprehensive assessment of the relative ease or complexity of grammar usually taught in intermediate German, reflecting actual classroom experiences, was the goal of this study. Numerous earlier research have offered helpful insights into the simplicity or complexity of particular grammatical patterns. For example, Arnett and Martin (2004) discovered that when creating the perfect, intermediate students typically choose the appropriate auxiliary verb; Even advanced learners struggle to use the case system in a formally correct, semantically, and discursively relevant manner, according to Liamkina (2008). Fagan (2019) suggested teaching learners to take into account

syllable stress and phonetic aspects when learning the superlative; Walter and MacWhinney (2015) discovered that explicit rule-driven instruction could assist adult L2 learners in using morphological signals to determine grammatical gender.

Modal and auxiliary verbs have a big impact on sentence structure and frequently necessitate rearranging the components of a clause. A thorough grasp of verb placement principles is essential due to this grammatical complexity, particularly when working with many verbs in a sentence. Since non-native learners must not only acquire the forms of modal and auxiliary verbs but also understand how these verbs determine the order of other sentence components, they usually struggle with these structures.

It should come as no surprise that this all too typical experience causes many educators to believe that additional grammar practice is necessary. A recent European poll published in Koenig (2001) found that over half of the grammar is the main focus of education in foreign language classes. For one thing, the inflection of the noun phrase is determined by three genders and four cases with a confusing inventory of morphemes including homonymous and polysemous forms. If the language to be learned is structurally as complex as German, teaching and learning foreign languages can become pure drudgery.

Learning vocabulary is not only a very personal endeavor that frequently occurs outside of the classroom, but it also continues for many years, if not a lifetime. Theoretically, apps—like the desktop applications that preceded them—can enhance this learning process in a number of ways. Do they, however, meet the technological and pedagogical expectations? When reviewing applications from an educational perspective, the emphasis is typically on general pedagogical and technological factors. However, linguistic elements should also be included in apps that concentrate on a particular language domain, like vocabulary. By incorporating features and utilizing speech recognition technology, the Learn German From Scratch mobile learning application was created on the Android platform to address these issues. The lecture notes for UTHM's German international language course are where the material was found. The application is developed using the Multimedia Mobile Content Development approach. Thirty target users participated in user acceptability testing, which produced positive results because over fifty-three percent of them expressed great satisfaction with the developed application.

According to Schmidt (1995), learning a second language occurs when the learner pays attention to the input, which includes noticing various phonological, morphological, pragmatic, discourse, etc. aspects. Based on the other experiments, Schmidt concludes that while observing new mental concepts without paying attention to them may lead to their detection, it is insufficient for their learning. Ortega (2013) explains the need for attention by stating that it results in a higher activation level of input in working memory.

**Methodology.**

This study aims to investigate the most effective methods used by learners to study German grammar. To achieve this, a survey was conducted among individuals currently learning German at various proficiency levels. The purpose of the survey was to identify which learning approaches—such as classroom instruction, self-study through books, mobile apps, online lessons, or conversational practice—are perceived as most effective by learners themselves. A structured questionnaire was designed and distributed online via social media platforms, language learning forums, and university networks. The survey consisted of both multiple-choice and open-ended questions. Participants were asked about their main method of learning German grammar, their perceived effectiveness of that

method, and the amount of time they dedicate to grammar study each week. Additional questions allowed for the exploration of mixed-method learning and personal tips or reflections. The responses were collected over a period of one week and analyzed quantitatively and qualitatively. Quantitative data helped identify the most commonly used and preferred methods, while qualitative responses provided deeper insight into learners' personal experiences and strategies. The results of the survey provide useful data to support practical recommendations for more efficient grammar learning techniques.

**Results.**

Based on the results of my survey, the most popular method for learning German grammar turned out to be classroom learning, with 30% of participants choosing it. Language learning apps like Duolingo and Babbel came next, gaining 25% of the responses. Online lessons, such as YouTube videos or Zoom classes, were selected by 20% of the respondents. Meanwhile, 15% preferred studying on their own, and only 10% thought that speaking with native speakers was the most effective way to learn grammar.

**Discussion.**

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,
2024-6.875 ResearchBib IF: 9.948 / 2024

The results of the survey reveal interesting insights into learners' preferences when it comes to studying German grammar. The fact that classroom learning was the most chosen method (30%) suggests that many learners still value structured environments and direct teacher guidance. It may also reflect the importance of face-to-face interaction and immediate feedback, which are often lacking in self-paced learning tools.

Language learning apps, which came in second with 25%, are likely popular because of their accessibility and engaging formats. These platforms offer flexibility and gamified learning experiences, which appeal to modern learners, especially those who prefer learning at their own pace. Online lessons (20%) were also seen as effective, possibly due to the rise of digital education during and after the pandemic. These lessons often combine visual, audio, and interactive elements, making them appealing for various learning styles.

Interestingly, only 15% of respondents chose self-study, and just 10% preferred speaking with native speakers. This might indicate that grammar, being rule-based and sometimes complex, is perceived as something that requires more structured methods rather than conversational practice.

Overall, the survey highlights a trend toward a blended approach, where traditional methods like classroom learning are still favored, but digital tools are gaining ground due to their convenience and effectiveness.

**Conclusion.**

To sum up, the survey shows that while traditional classroom learning remains the most trusted method for mastering German grammar, digital tools like language apps and online lessons are becoming increasingly popular. Learners seem to prefer methods that offer structure, guidance, and a sense of progress. Although self-study and speaking with native speakers are less common choices, they still play a role in the overall learning process. These results suggest that combining different methods might be the most effective way to improve grammar skills in a foreign language.
