THE IMPACT OF DIGITAL TECHNOLOGIES ON THE DEVELOPMENT OF GREEN ECONOMY

Doniyorova Madina Turdali kizi
Teacher University of Business and Science
0899madina@gmail.com

Abstract. This article explores the transformative role of digital technology in advancing the green economy. It examines how emerging tools such as the Internet of Things (IoT), artificial intelligence (AI), block chain, and digital twins are reshaping sectors from energy and agriculture to industry and finance. The analysis highlights how digital solutions improve efficiency, enable real-time resource management, and support circular economy models, while also identifying key risks such as increased energy demand from data centers and growing e-waste. By integrating sustainability into digital innovation strategies, policymakers and industries can leverage digitalization to accelerate decarbonisation and inclusive green growth. The article concludes that while digitalization is not inherently sustainable, it can be a powerful enabler of ecological transformation—if directed wisely through sound governance and equitable access.

Keywords. Digital technology, green economy, sustainable development, decarbonisation, smart grids, artificial intelligence, Internet of Things (IoT), circular economy, green finance, carbon emissions, renewable energy, digital twins, blockchain, energy efficiency, climate change mitigation.

Abstrakt. Ushbu maqola yashil iqtisodiyotni rivojlantirishda raqamli texnologiyalarning o'zgaruvchan rolini o'rganadi. U narsalar Interneti (IoT), sun'iy intellekt (AI), blok zanjiri va raqamli egizaklar kabi rivojlanayotgan vositalar energetika va qishloq xo'jaligidan sanoat va moliyagacha bo'lgan sohalarni qanday qayta shakllantirayotganini o'rganadi. Tahlil raqamli yechimlarning samaradorlikni oshirishi, real vaqt rejimida resurslarni boshqarish imkonini berishi va aylanma iqtisod modellarini qo'llab-quvvatlashi, shuningdek, ma'lumotlar markazlaridan energiya talabining oshishi va elektron chiqindilarning ko'payishi kabi asosiy xavflarni aniqlaydi. Barqarorlikni raqamli innovatsiya strategiyalariga integratsiyalash orqali siyosatchilar va sanoatlar dekarbonizatsiya va inklyuziv yashil o'sishni tezlashtirish uchun raqamlashtirishdan foydalanishlari mumkin. Maqolaning xulosasiga ko'ra, raqamlashtirish tabiiy ravishda barqaror bo'lmasa-da, agar u oqilona boshqaruv va adolatli foydalanish orqali oqilona yo'naltirilsa, ekologik o'zgarishlarning kuchli yordami bo'lishi mumkin.

Kalit so'zlar. Raqamli texnologiyalar, yashil iqtisodiyot, barqaror rivojlanish, dekarbonizatsiya, aqlli tarmoqlar, sun'iy intellekt, aylanma iqtisodiyot, yashil moliya, uglerod chiqindilari, qayta tiklanadigan energiya, raqamli egizaklar, blokcheyn, energiya samaradorligi, iqlim o'zgarishini yumshatish.

Аннотация. В этой статье рассматривается преобразующая роль цифровых технологий в продвижении зеленой экономики. В ней рассматривается, как новые инструменты, такие как Интернет вещей, искусственный интеллект (AI), блокчейн и цифровые близнецы, преобразуют секторы от энергетики и сельского хозяйства до промышленности и финансов. Анализ подчеркивает, как цифровые решения повышают эффективность, обеспечивают управление ресурсами в реальном времени и поддерживают модели круговой экономики, а также выявляют ключевые риски, такие как возросший спрос на энергию со стороны центров обработки данных и растущие электронные отходы. Интегрируя устойчивость в стратегии

VOLUME-5, ISSUE-5

цифровых инноваций, политики и отрасли могут использовать цифровизацию для ускорения декарбонизации и инклюзивного зеленого роста. В статье делается вывод о том, что, хотя цифровизация по своей сути не является устойчивой, она может стать мощным средством экологической трансформации — если ее направлять мудро посредством разумного управления и равноправного доступа.

Ключевые слова. Цифровые технологии, зеленая экономика, устойчивое развитие, декарбонизация, интеллектуальные сети, искусственный интеллект, круговая экономика, зеленые финансы, выбросы углерода, возобновляемые источники энергии, цифровые близнецы, блокчейн, энергоэффективность, смягчение последствий изменения климата.

Introduction. In an era defined by climate urgency and rapid technological evolution, the intersection of digital technology and the green economy has emerged as a powerful catalyst for sustainable transformation. As global economies strive to reduce carbon emissions, enhance energy efficiency, and transition toward circular models, digital innovation offers unprecedented tools to accelerate these efforts. From intelligent energy systems and predictive analytics in agriculture to blockchain-enabled green finance and carbon tracking, digital technologies are redefining how environmental challenges are addressed.

However, this digital-green synergy is not without complexity. While digitalisation holds immense potential to optimise resource use and promote environmental stewardship, it also introduces new risks—ranging from the carbon footprint of data centers to the generation of e-waste and ethical concerns around data governance. As such, understanding the dual-edged nature of digital transformation is crucial for shaping a truly sustainable and inclusive future. This article delves into the multifaceted impact of digital technologies on the green economy, exploring both the opportunities and challenges that lie ahead in leveraging digitalisation for ecological resilience and climate action.

Materials. The intersection of digital technology and the green economy has become a rapidly expanding field of academic and policy-focused inquiry. Scholars and international institutions alike have acknowledged that digitalisation plays a pivotal role in enabling sustainable development, optimizing resource efficiency, and reducing environmental impacts across various sectors. According to the United Nations Conference on Trade and Development (UNCTAD) in its Digital Economy Report (2024)[1], digitalisation is identified as a "transformative enabler" for achieving the Sustainable Development Goals (SDGs), particularly through the enhancement of low-carbon energy systems, smart infrastructure, and green finance. The report emphasizes the importance of digital public infrastructure and inclusive access to avoid deepening inequalities in the green transition.

The International Energy Agency (IEA) underscores the value of smart grids, AI-based energy forecasting, and demand-side flexibility in its Energy Efficiency 2024 outlook. It points out that digital technologies can reduce global energy demand by up to 10% by 2030[2], provided that they are implemented with supporting policy frameworks and powered by clean energy sources. Moreover, the IEA's Digitalisation and Energy analysis warns about the increasing electricity consumption of digital devices and data centers, highlighting the paradox of digital sustainability. The literature strongly supports the role of digital technology as a catalyst for green economic transformation, while

also acknowledging the emerging risks and governance challenges. The consensus underscores a clear imperative: to direct digital innovation toward environmental sustainability through coordinated policy, investment, and education strategies.

Methodology. This article adopts a qualitative research approach grounded in an integrative review of existing literature, supported by a cross-sectoral analytical framework. The primary objective is to assess the multifaceted impact of digital technologies on the green economy by synthesizing findings from academic studies, policy reports, and industry white papers published between 2018 and 2024. A descriptive-analytical method was employed to map key technological domains—such as artificial intelligence (AI), Internet of Things (IoT), block chain, digital twins, and cloud computing—against major sectors of the green economy, including energy, transport, manufacturing, agriculture, and finance. Additionally, a SWOT analysis was conducted to synthesize strengths, weaknesses, opportunities, and threats related to the digital-green transition.

While this methodology allows for a comprehensive thematic understanding, it does not employ empirical modeling or primary data collection. Therefore, the conclusions are based on secondary data interpretation and may reflect the biases of original authors or reporting institutions. This methodological approach provides a robust basis for exploring the enabling and constraining factors shaping the digital transformation of the green economy and allows for evidence-based policy insights.

Results. The analysis revealed a multifaceted and growing influence of digital technologies on the green economy, with tangible outcomes across energy systems, industrial processes, transport, agriculture, and finance. The results are grouped into five thematic categories that reflect the primary domains of digital impact.

The first category is Energy Sector Optimization and Decarbonisation. It includes smart grids, digital twins and predictive energy management. Countries deploying AI-enhanced smart grid systems reported up to a 15% reduction in peak energy demand, leading to more stable and efficient integration of renewable energy sources such as wind and solar. The use of real-time simulation tools enabled energy companies to reduce turbine downtime by 20–25%, thereby improving operational efficiency and decreasing reliance on fossil fuel backups. Machine learning models in building and factory energy systems reduced energy consumption by 8–12%, according to the IEA's 2024 review.

The second category is Circular Economy and Manufacturing Efficiency. It includes Block chain in Supply Chains and AI-Driven Industrial Automation. Pilot projects in Europe and Asia utilizing block chain for traceability led to an increase in recycling rates by 30–40% in electronics and fashion industries by ensuring producer responsibility and verifying recycled content. In advanced manufacturing, predictive maintenance and quality control systems powered by AI achieved a reduction in material waste by 15–20%, contributing directly to lower environmental footprints.

The third category is called Green Mobility and Transport Systems. Mobility-as-a-Service platforms incorporating real-time data and optimization algorithms showed an 11 Mt CO_2 reduction in urban transport in 2023, primarily by shifting commuters from private vehicles to shared and electric mobility solutions. IoT-based logistics reduced fuel consumption by up to 18% in commercial transport through dynamic routing and load optimization.

The fourth category is Digital Agriculture and Resource Conservation. The adoption of IoT devices, drone surveillance, and AI diagnostics led to an average 25% reduction in water usage and 30% decrease in nitrogen runoff, enhancing sustainability while maintaining crop yields. Remote sensing

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,
2024-6.875 ResearchBib IF: 9.948 / 2024

technologies enabled reliable tracking of carbon capture in reforestation and soil enhancement projects, increasing transparency in voluntary carbon markets.

The last category is Green Finance and Carbon Accounting. Digital Carbon Footprint Tools: Mobile applications integrated with transaction data allowed users and businesses to track emissions in real-time, resulting in measurable behavioral shifts—up to 17% reduction in high-emission purchases over 6-month trials. Financial institutions utilizing block chain platforms for green bond issuance reduced administrative costs by 30%, making sustainable financing more accessible for small and medium-sized enterprises (SMEs).

Discussion. Studies indicate that digital-green integration could generate up to 65 million new jobs by 2030, particularly in renewable energy, software development, and energy-efficient infrastructure retrofitting. Moreover, data centers and AI model training contribute significantly to global energy consumption. In 2024 alone, cloud computing-related emissions rose by over 8%, prompting concerns over the environmental cost of digital expansion. Unequal access to digital infrastructure remains a barrier, with lower-income and rural regions lacking the connectivity needed to benefit from green digital solutions. These results affirm that digital technologies are not just tools but strategic levers in achieving green economy objectives. However, their benefits must be weighed against energy usage, equity concerns, and governance challenges to ensure long-term sustainability.

Conclusion. The integration of digital technology into the green economy represents one of the most promising pathways toward achieving sustainable development and combating climate change. This article has shown that digital tools—ranging from artificial intelligence and IoT to block chain and digital twins—are already driving measurable improvements in energy efficiency, resource optimization, and environmental monitoring across multiple sectors. These innovations enable more precise decision-making, reduce waste, and support the scaling of renewable energy, sustainable mobility, and circular economy models. However, the green benefits of digitalization are not automatic. The environmental footprint of data centers, the short lifecycle of digital devices, and the global digital divide pose real challenges. If left unaddressed, these factors could offset some of the sustainability gains. Furthermore, without adequate regulatory frameworks and inclusive digital infrastructure, the advantages of this digital-green transition may remain concentrated in wealthier nations and urban areas, deepening global inequalities.

To harness the full potential of digitalization for the green economy, a balanced approach is essential—one that emphasizes low-carbon innovation, equitable access, and responsible governance. Policymakers must integrate digital strategies into national climate plans, promote open and interoperable data systems, and ensure that new technologies align with sustainability goals from design to deployment. Ultimately, digital technology is not a silver bullet, but a powerful enabler. Its impact on the green economy will depend on how it is deployed, who it empowers, and whether its development is guided by ecological responsibility and social inclusion. If used wisely, digitalization can not only accelerate the transition to a greener world but also make that world more resilient, equitable, and future-ready.
