Dekhkambayeva Zulfiya Abubakirovna

ABSTRACT: This article aims to evaluate the scientific research methods of pedagogical technologies in radiology education, and explores the importance of identifying the effectiveness of various educational resources and integrating them into the educational process. While traditional educational resources play an important role in conveying theoretical knowledge, it is emphasized that digital educational tools, including interactive platforms and multimedia content, are effective in strengthening practical skills. In particular, the use of simulation technologies and virtual reality environments in radiology education can help improve students' professional readiness. In addition, automated analysis tools with the help of artificial intelligence can be important in developing diagnostic thinking. Social media tools, when integrated into the pedagogical process, can serve to create opportunities for independent learning for students and increase the effectiveness of knowledge sharing. In general, there is an opportunity to improve educational outcomes for medical students by identifying various pedagogical technologies and integrating them into radiology education. The introduction of teaching methods based on modern technologies serves to develop students' practical diagnostic skills and prepare them for mastering advanced diagnostic methods.

Keywords: Radiology education, pedagogical technologies, scientific research methods, innovative pedagogical approaches, diagnostic thinking, artificial intelligence, interactive platforms, medical education

Introduction. The growing focus on digital learning in medical education has been particularly evident during the COVID-19 pandemic. This has further increased the need for comprehensive online resources for diagnostic radiology. Despite the important role of radiology in medical diagnosis and treatment, the level of teaching of this subject in medical higher education institutions has been decreasing in recent years. For example, during the 2019–2020 academic year, only 16% of medical schools in the United States made radiology a mandatory clinical internship, compared to 24% in 2014–2015. Also, in 2017–2018, 135 out of 147 medical schools integrated radiology into other courses, but only 29 offered stand-alone radiology courses. While the decline in radiology in medical education has been cited as one reason for this trend, another possible reason is the shift in radiology education from a theoretical knowledge-based approach to an interactive and practical one, reflecting the increasing need for this field in modern healthcare [14–15]. Interpretation of diagnostic images is an important skill for medical graduates, as imaging techniques are widely used in practical medicine. However, radiology is often under-represented in medical curricula. In addition, radiology education in medical schools can lead to a deeper understanding of the importance of imaging, which in turn can lead to positive outcomes such as choosing the right imaging modality, making a timely diagnosis, and improving patient care. There is no general agreement on how to teach radiology at

ISSN: 2582-4686 SJIF 2021-3.261, 2022-2.889, 2023-5.384, 2024-6.875 ResearchBib IF: 9.948 / 2024

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-5, ISSUE-5

the undergraduate level, and approaches to this matter vary widely around the world. There are significant differences in the topics covered in radiology, the level at which it is presented to students, and the training of teaching staff. In addition to traditional lectures, small group seminars, case studies, or clinical practice models are used. In recent years, a number of modern methods have been introduced in the teaching of radiology. These include eLearning, the “flipped classroom” model, and simulator programs that develop diagnostic thinking [11,18]. The role of innovative pedagogical technologies in modern medical education is increasingly increasing. In particular, the process of mastering radiology requires students to acquire not only theoretical knowledge, but also to develop practical skills, such as image analysis, clinical reasoning, and diagnostic decision-making [1]. Therefore, improving pedagogical methods, integrating them with modern technologies, and increasing the effectiveness of education have become important scientific directions. Various pedagogical methods, such as problem-based learning, interactive learning, simulation technologies, and artificial intelligence-based teaching, are suitable for the specific characteristics of radiology [4]. These approaches greatly contribute to the development of students' independent thinking skills, a deep understanding of complex diagnostic processes, and clinical experience [12].

Methods. One of the modern pedagogical technologies in radiology education is social media. Since the beginning of the 21st century, social media has become a leading form of digital mass communication. Social media are online applications or websites that allow for the exchange of information through virtual communities, public posts, and private correspondence. These platforms are increasingly popular among the general public, including radiologists. Many leading radiological societies have now incorporated social media into their educational strategies, using them as a means to share and discuss radiological images, enhance communication with clinicians and patients, increase interest in the field, and demonstrate the human side of the radiology profession. The use of social media in radiology institutions increases the visibility and participation of radiologists in the online virtual community. However, many radiologists are still not fully aware of the valuable information and interaction opportunities available on social media and the value these platforms add to their daily practice. As of 2025, the most popular social media platforms in terms of monthly active users are: Facebook (2.7 billion), YouTube (2 billion), WhatsApp (2 billion), Instagram (1.1 billion), and TikTok (0.69 billion). TikTok also remains the fastest growing social media platform [13].

Teaching Radiology through Social Media

Integrating social media into radiology education plays a key role in enhancing the effectiveness of the learning process. These platforms provide educators with the following opportunities:

Interactive learning: Students develop independent analytical skills by working with real clinical cases and radiological images.

Discussion and analysis: Through radiology forums and groups, students have the opportunity to communicate with experts, express their views, and discuss diagnostic conclusions.

Use of audiovisual materials: The distribution of video lectures and educational content through platforms such as YouTube and TikTok helps students to understand the subject in a deeper way.

Rapid networking: By joining the global radiology community, students and young professionals will have access to learning opportunities and knowledge exchange platforms.

Integrating social networks with pedagogical technologies into the educational process will significantly improve students’ professional competencies. Therefore, this study analyzes the mechanisms of integration of social networks in radiology education, their advantages and effectiveness [2,8].

ISSN: 2582-4686 SJIF 2021-3.261, 2022-2.889, 2023-5.384, 2024-6.875 ResearchBib IF: 9.948 / 2024

The development of artificial intelligence technologies is having a significant impact on the educational process. In particular, language models such as ChatGPT are enabling the formation of innovative pedagogical approaches in radiology education. This study analyzes the role, effectiveness and impact of ChatGPT technology in radiology education. ChatGPT can help radiologists make decisions by analyzing clinical cases, forming diagnostic hypotheses and quickly processing data. This technology also simplifies the processes of systematizing radiology educational materials, compiling reports and clarifying clinical conclusions, which optimizes the educational process.

ChatGPT functions serve to develop students' analytical thinking skills, explain complex diagnostic situations, and form independent decision-making abilities [9]. However, the full integration of this technology into clinical education still has some limitations. The accuracy and reliability of the information provided by ChatGPT requires strict control. In this regard, the use of ChatGPT in radiology education was evaluated in the framework of this study using an experimental-testing method. Through practical exercises with students, the effectiveness of ChatGPT in explaining diagnostic processes, analyzing clinical situations, and developing students' independent thinking skills was studied. This scientific approach is aimed at identifying the advantages and possible limitations of integrating ChatGPT technology into radiology education. In the future, it will be important to develop specific pedagogical strategies for the effective introduction of this technology into the educational process [17].

The medical field is constantly undergoing fundamental changes to improve medical capabilities and the quality of education through the introduction of new and revolutionary technologies. Radiology is at the forefront of these changes, actively implementing new technologies into daily practice. This field is constantly evolving, embracing modern technologies to increase diagnostic accuracy, improve patient care, and increase work efficiency. Currently, one of the leading technologies in this transformation is virtual reality (VR).

Virtual reality is a computer-generated simulation environment that fully immerses the user in an artificial, three-dimensional environment and allows them to interact with it in a way that is close to real life. Such an experience is provided by a combination of specialized hardware and software. The central components of virtual reality technology are tracking devices that detect the user's eye or head movements and a visual interface that displays virtual objects depicted through it in real time. A head-mounted display (HMD) is equipped with software that tracks internal eye or head movements and provides visualization, while hand-held controllers detect the user's hand movements and provide haptic (touch) feedback. The combination of these technologies creates a realistic 360-degree viewing experience and allows the user to simulate real-life tasks in a virtual environment [5].

When it comes to interactive platforms in radiology education, I will provide information on some of them below.

Radiopaedia.org is a free and open access, peer-reviewed radiology educational website for medical students and other healthcare professionals. Radiopaedia.org aims to cover the main areas of radiology, as well as the latest advances and research in the field. This platform is a collaborative project where users can post their own clinical cases, articles, tests, and videos, or edit and improve existing content. Since open editing is allowed, users are encouraged to cite relevant sources for the information provided. Radiopaedia.org is an essential resource for anyone interested in learning more about radiology. The platform provides quick access to information for medical students, as well as resources that are useful for identifying specific clinical cases and specific radiological signs. Learning Radiology is an educational platform that covers a wide range of radiology topics and offers

ISSN: 2582-4686 SJIF 2021-3.261, 2022-2.889, 2023-5.384, 2024-6.875 ResearchBib IF: 9.948 / 2024

a variety of PowerPoint-style presentations. The platform is known for its diverse collection of visual materials and interactive tests, which are effective tools for reinforcing the learning process. The platform is based on the book Learning Radiology: ''Recognizing the Basics'', which serves as an additional learning resource. One of the strengths of this platform is its ability to present complex radiological concepts in a simple and understandable format, which is especially useful for medical students and radiology residents. The interactive teaching method, which is carried out through tests and detailed presentations, plays an important role in developing the foundations of radiological image analysis and diagnosis [15].

Introduction to Radiology provides a foundational understanding of radiological practices and principles. This resource is especially useful for beginners in the field, as it provides a systematic and methodical learning path that allows you to thoroughly master the basics of radiology. With a special focus on the fundamentals of radiology, this resource is an important resource for building a solid foundation in radiology education.

The CTisus platform provides a comprehensive, case-based learning experience that is essential for radiology education. It integrates the PEARLS (Practical Evidence About Real Life Situations) system, which offers students practical advice that is updated monthly. PEARLS highlights key radiological signs and diagnostic recommendations, providing students with a dynamic source of information to apply theoretical knowledge to practical situations. The platform groups these materials by system (e.g., cardiovascular, abdominal, neurological, etc.), which is tailored to professionals with interests in different fields and encourages active participation [10].

Results. One of the directions for integrating virtual reality-based "classrooms" into radiology education is explained by the fact that this technology serves to enrich the learning experience and effectively assimilate knowledge for medical students. The scientific literature has consistently noted that virtual reality technology is an effective method for teaching anatomy. At the same time, simulations with a high level of realism lead to more effective acquisition of broad clinical knowledge and skills [6]. In the field of radiology, the interactive and dynamic features of this technology contribute to a deeper understanding of complex anatomical structures and pathologies. At the same time, the realistic and virtual experiential environment of the classroom can increase interest in this field among medical students.

In early studies using virtual reality technologies, students were taught radiological anatomy in a virtual experience environment similar to a game environment. In this virtual environment, students analyzed individual sections of various medical images (e.g., CT, MRI, X-ray). The results showed that students trained in radiological anatomy using virtual reality achieved higher exam results than those trained using traditional methods (conferences, seminars, clinical practice). Researchers attribute this advantage to the dynamic and interactive teaching style of the virtual reality environment, which is more effective than traditional passive learning methods [3,16]. The development of medical education on Twitter is closely related to the emergence of the concept of free and open medical education (FOAMed), a movement promoted by many doctors as a means of globalizing medical knowledge on the Twitter platform. Because of the ability to filter content by topic, one of Twitter's key features, the hashtags #radFOAMed and #radres have become widely adopted to highlight tweets related to radiology education. In addition, major radiology conferences have also begun to cover their educational events on Twitter. For example, Hawkins et al. reported that Twitter activity at the 2012 Radiology Society of North America (RSNA) conference increased by 30% compared to 2011 [8].

ISSN: 2582-4686 SJIF 2021-3.261, 2022-2.889, 2023-5.384, 2024-6.875 ResearchBib IF: 9.948 / 2024

Among social media platforms, TikTok stands out as one of the fastest-growing platforms in recent years, with its short-form video format. An analysis of the first 100 videos generated by the algorithm in response to the query #radiology on TikTok showed that only 8 videos were related to radiology education, with the main categories being 46 videos on the topic of "work and life in radiology" and 24 videos related to humor or memes. A similar study by Lovett and co-authors analyzed 300 posts found using the keyword "radiology" and found similar trends: the vast majority of videos were related to work and lifestyle, with only 16% of videos being about clinical topics, particularly educational content. These results suggest that TikTok is currently serving more as a space for entertainment and personal expression. However, it is argued that this platform has great potential for professional use in radiology in the future [13].

Instagram is the leading social network for sharing user-generated audiovisual content. Since radiology is a predominantly visual field of medicine, the Instagram platform offers unique opportunities for radiology education. In addition, the majority of Instagram users are between the ages of 18 and 29, a demographic that includes mainly medical students and residents. Therefore, this platform is a promising tool for FOAMed (free open medical education) in radiology.

Currently, radiology content on Instagram is mainly maintained by radiology departments, radiological societies, and individual physicians. These users contribute by posting interesting clinical cases and educational materials. It is worth noting that the majority of these accounts are individual physicians [2].

Discussion. The digital transformation of radiology education, i.e. the expansion of online resources, represents a fundamental shift in the approach to medical education. The results of this analysis are assessed within the broader context of radiology education and are compared with previously published analyses to highlight advances and ongoing challenges in the field. For example, research by Smith et al. (2018) documented the development of online radiology resources, particularly the growing importance of case-based learning platforms and multimedia tools. Smith et al. identified the main resources at that time and found that they consisted of static images and text-based textbooks, and that these resources were widely used due to their simplicity and accessibility. However, these resources were limited in terms of interactivity and depth, especially for advanced learners [13,15].

On the contrary, our analysis demonstrates a significant shift towards more interactive and dynamic forms of digital tools, notably the integration of artificial intelligence and virtual reality technologies. These advances are fundamentally transforming radiology education, enabling students to engage with complex radiological situations in ways that were previously impossible. For example, AI-powered platforms are creating personalized learning paths, adapting content to the learner's development, and providing real-time feedback on diagnostic accuracy. Similarly, virtual reality applications are expanding the scope of practical training and enriching the hands-on experience for medical students and residents through simulations that are close to real-world clinical situations in a controlled environment [5–6].

Conclusion. The role of modern technologies, including artificial intelligence, simulation systems, virtual reality, and social media, in radiology education and practice is expanding. Virtual reality technologies are making radiology teaching, medical image analysis, and knowledge sharing more efficient. While AI systems like ChatGPT are showing promise in radiology, further research is needed to ensure their full accuracy and reliability. Therefore, extensive scientific research is essential to assess the limitations of these technologies and ensure their safe integration into clinical

practice. In addition, social networks are creating new opportunities for radiologists to form a global community, exchange scientific information, and engage in education and professional development. Although research on the phenomenology of social networks in radiology is still limited, technological advances and creative approaches are expected to play an even more important role in the future. Therefore, developing comprehensive strategies for integrating modern technologies into the pedagogical process and evaluating their effectiveness in education remains one of the urgent scientific tasks.
