SUSTAINABILITY OF HYDROPOWER IS RESOURCE SAVING

Matyoqubov Fayzullo Ortiqboy o`g`li
student of the Ecology and Environmental Protection program.

Annatatsiya: Qayd etish joiz, keyingi paytda mamlakatimizda energetika sohasini diversifikatsiya qilishga, xususan, quyosh, shamol, suvdan elektr energiyasi olishga katta e'tibor qaratilmoqda. Viloyatda kichik GESlar qurish orqali elektr energiyasi yetishmovchiligini kamaytirish, energiya mustaqilligini ta'minlash va atrof-muhitga salbiy ta'sirni kamaytirish mumkin. 1 megavattgacha quyosh va shamol, 5 megavattgacha mikro GESlarning ortiqcha elektr energiyasi kamida 15 yil davomida "Hududiy elektr tarmoqlari" AJ va davlat tomonidan kafolatli xarid qilinadi

Kalit so`zlar: Kichik GES, gidroenergetika, gidroenergetika, gidroelektr

Аннотация: Следует отметить, что в последнее время в нашей стране уделяется большое внимание диверсификации энергетической отрасли, в частности, получению электроэнергии из солнечной, ветровой и гидроэнергии. В области можно уменьшить нехватку электроэнергии, обеспечить энергетическую независимость и снизить негативное воздействие на окружающую среду за счёт строительства малых ГЭС. Избыточная электроэнергия от солнечных и ветровых установок мощностью до 1 мегаватта, а также от микро-ГЭС мощностью до 5 мегаватт будет гарантированно выкупаться АО "Региональные электрические сети" и государством в течение не менее 15 лет.

Ключевые слова: Малые ГЭС, гидроэнергетика, гидроэлектроэнергия

Abstract: It should be noted that in recent times, great attention has been paid in our country to diversifying the energy sector, particularly to the generation of electricity from solar, wind, and hydropower sources. In the region, it is possible to reduce electricity shortages, ensure energy independence, and minimize negative environmental impacts through the construction of small hydropower plants. Surplus electricity generated from solar and wind installations up to 1 megawatt, and micro-hydropower plants up to 5 megawatts, will be guaranteed to be purchased by the Joint Stock Company "Regional Electric Networks" and the state for at least 15 years.

Keywords: Small hydropower plants, hydropower, hydroelectric energy

Over the past five years, as a result of implemented projects, the electricity generation capacity has increased from 1,731 MW in 2017 to 2,053 MW in 2021. New capacities with a total of 244 MW have been launched. In particular, 13 new modern hydroelectric power stations were constructed, and 9 existing hydroelectric power stations were fully modernized in accordance with modern standards. However, despite these achievements, nearly 50% of the country's hydroenergy potential still remains untapped.

In hydropower, water bodies, seas, reservoirs, rivers, canals, and drainages play a major role. Since there is no sea in Khorezm, hydropower is mostly used from natural water bodies and reservoirs. There were about 400 natural water bodies in the Khorezm region in 2010. Currently, they have decreased to about 250.[2.3.4.5.6]

Taking this into account, Uzbekhydroenergo JSC has planned to implement a total of 20 large-scale projects with an additional 740 MW of capacity between 2022 and 2026, according to the Chairman of the Board and Senator Abdugani Sanginov. Specifically, in 2022, 8 projects with a combined capacity of 258 MW were planned, including 4 new constructions and 4 modernization projects. In 2023–2024, 8 more projects with 76 MW capacity are planned, and in 2025–2026, 4 projects totaling 506 MW.

It is noteworthy that in recent times, great attention has been paid in our country to diversifying the energy sector, particularly to generating electricity from solar, wind, and hydropower sources. Naturally, the growing population and economy of New Uzbekistan are steadily increasing the demand for energy every year. According to expert estimates, by 2030, the production capacity of the sector should reach 25,000 MW, with annual electricity generation totaling up to 120 billion kilowatt-hours.

In order to support widespread use of renewable energy sources by the population and business entities, mechanisms are being introduced by the state. These include providing electricity and heat energy through renewable sources, encouraging the efficient use of energy resources in administrative, residential, and industrial facilities. To this end, on September 9 of this year, the President of Uzbekistan signed a decree titled “On Additional Measures for the Implementation of Energy-Saving Technologies and the Development of Small-Scale Renewable Energy Sources.”

This document emphasizes:

- Financial incentives for the purchase of renewable energy devices by households and businesses;
- Implementation of targeted measures to apply alternative energy sources in buildings, neighborhoods, and homes;
- Enhancing the investment attractiveness of business projects focused on the construction of micro and small hydroelectric power stations;
- Broad support for entrepreneurs involved in the production of solar, wind, and small hydroelectric station equipment.

It is well known that hydroturbines generate power through rapid water flow. The faster the water flows, the more electricity it produces. These systems do not damage the natural landscape or the environment during construction and operation, and they do not negatively affect water quality, preserving its natural characteristics. Compact hydroelectric plants are efficient in every way and are a relatively cost-effective method of producing electricity.

Constructing small hydropower plants in the region can help reduce electricity shortages, ensure energy independence, and minimize environmental impacts. This work will contribute to the development of practical recommendations for building small hydroelectric power plants and is of great importance for the integration of renewable energy sources.

The recent abnormal cold wave in Uzbekistan caused a collapse in energy supply, with power outages observed throughout the country. On January 19, the President of Uzbekistan, Shavkat Mirziyoyev, held a meeting to address this issue. Following the meeting, he was presented with plans for the hydropower sector. It was announced that work had begun on constructing small hydropower plants across the country, which is expected to significantly increase the effectiveness of the hydropower sector in the future.

According to the standards, power plants with a capacity of up to 500 kilowatts are classified as small hydropower plants. We have conducted three years of research on the implementation of

such plants in Uzbekistan. Although we currently lack full technical capabilities, we will gradually localize this experience by adapting the practices of other developed countries to our context.

Small hydropower plants are cost-effective. We are now converting water energy into electricity – a resource that translates into money every minute, every second, and every hour. This sector can rightly be considered a highly promising business.

Depending on the type of water resource, different types of small hydropower stations can be installed. Their feasibility is calculated based on flow speed and pressure – the two key indicators. Accordingly, it is determined what type of equipment will be installed, its expected efficiency, and over what period it will pay for itself. Industrial experts calculate this data precisely.

Practical Significance of the Work:

The study aims to identify suitable sites for the construction of small hydroelectric

power stations in the Khorezm region by analyzing water resources, develop the technical and economic mechanisms necessary for project implementation, and assess their impact on energy supply, socio-economic development, and environmental sustainability.

The following practical outcomes are envisioned within the scope of the work:

- Mapping areas suitable for the construction of small hydropower stations;
- Developing preliminary feasibility studies for each potential site;
- Forecasting the expected volume of energy production;
- Providing recommendations for reducing the need for energy imports based on the project.

Initial pricing is calculated relative to the tariff set for Group II consumers. The price of electricity will vary according to the established tariff, specifically:

- For hydroelectric power plants with a capacity of up to 500 kW – 150% of the base tariff;
- For plants with a capacity from 500 kW to 2 MW – 120% of the base tariff;
- For plants with a capacity from 2 MW to 5 MW – 100% of the base tariff.

Additionally, surplus electricity generated from solar and wind installations up to 1 MW and micro-hydropower plants up to 5 MW will be guaranteed to be purchased by the Joint Stock Company "Regional Electric Networks" and the state for at least 15 years.

The proposed strategy for the development of renewable energy sources in the region will help modernize the energy infrastructure of Khorezm region, create new jobs, and contribute significantly to the transition toward a green economy. The implementation of these promising projects will bring light to hundreds of thousands of homes, meet the daily needs of the general population, and provide new employment opportunities for many businesses and entrepreneurs.

In conclusion, the development of the hydropower sector not only increases the country's electricity production capacity, but also improves the living standards of people in areas where new and modernized hydrotechnical structures are located, ensures reliable power supply to production facilities, and ultimately lays the foundation for the further growth of Uzbekistan’s economy.
