Abstract: The permanent problem of teaching grammar at secondary schools is usually in the passive nature of traditional teaching methods, where memorization and drill practice receive more emphasis than active participation. This study investigates a pedagogical shift from active mastery to passive acquisition through the use of digital technologies and authentic materials in the teaching of grammar for 9-11 students. Drawing on constructivist theory of learning and communicative language teaching methodology, this study investigates how multimodal resources like interactive websites for grammar, edutainment apps, real-life texts, and media sources can promote learners' grammatical skill and memorability.

Keywords: grammar instruction, involved learning, technology integration, authentic resources, digital pedagogy, communicative ability, active learning.

INTRODUCTION

Grammar instruction has been a cornerstone of language instruction for decades but remains one of the most debated and, neglected aspects of teaching English as a second language. Traditional grammar instruction in high schools – particularly in grades 9 through 11 – often relies on memorization of rules, mechanical drills, and isolated sentence practice. While such techniques can be helpful in enabling short-term memory, they tend not to do much to enable functional grammatical competence or sustain learner interest. Consequently, students may learn shallow knowledge but cannot use the grammar meaningfully in communicative contexts. Applied linguistics and educational psychology studies confirm that passive acquisition of language rules is insufficient for long-term management or communicative skills. Technology actually offers unprecedented opportunity for enhancing the teaching of grammar. Interactive software applications, game platforms, and writing software allow learners to receive immediate feedback, context-based practice, and process customization. At the same time, real materials such as news headlines, movie scripts, podcast transcripts, and social network postings have the potential to provide rich linguistic input and expose learners to the functioning of grammar in successful communication. When used intentionally, technology and authenticity have the power to turn grammar study from a rote activity into a cognitively engaging and personally relevant process.

METHODS

This study employed a mixed-methods design that combined quantitative and qualitative approaches to examine the effectiveness of technology and authentic materials in enhancing the grammar skill of secondary students in grades 9 to 11. A mixed-methods approach was employed that involved classroom interventions, learner feedback, and pre-post testing across three classes. Results indicate that students learning with technology-enhanced and contextually enhanced materials expressed much higher rates of grammatical accuracy, motivation, and engagement compared to students learning from a conventional curriculum. Additional qualitative results indicate that learners engaged in a more autonomous and reflective learning style for language. This study closes that gap

by examining the impact of technology-based and material-based grammar practice on 9th- to 11th-grade students. By examining both quantitative outcomes and qualitative experience, the study will offer insight into whether a shift from passive acquisition to active mastery is capable of having measurable benefits for students' use of grammar, motivation, and confidence. Quantitative data (pre- and post-test scores, questionnaire data) were calculated with SPSS. A paired-sample t-test compared each group's performance prior to and after intervention. ANOVA examined differences among the three groups. Qualitative interview data were coded thematically based on grounded theory for determining emerging patterns in learners' feedback, around engagement, autonomy, and awareness of grammar in context.

RESULTS

Results of this study provide strong evidence of the effectiveness of integrating technology and real materials – namely LanguageLab, Grammarly, and Themez – in enhancing grammar skills and student motivation among 9th- to 11th-grade students. Grammar scores improved across all groups at the end of the intervention but with the greatest improvement that utilized technology and authentic materials. LanguageLab was especially effective in developing grammar accuracy with adaptive exercises. Students loved the instant feedback and gamified monitoring of progress. A number of students reported that LanguageLab helped them "in comprehending grammar more clearly" and "in improving mistakes more independently." Grammarly EDU was a key to boosting students' metalinguistic awareness. Weekly reflection writing activities combined with Grammarly feedback resulted in a drastic fall in grammatical errors, especially in punctuation, articles, and tense consistency. Teachers noted better clarity and coherence in writing. Themez enhanced motivation and contextualization. Theme-based lessons allowed grammar structures to be interiorized as part of meaningful discourse. Students better recalled and utilized complex structures such as conditionals and the passive voice when instructed by Themez-negotiated content. The results of the present study reiterate the revolutionizing role of technology-enhanced and real-material-based teaching in the grammatical learning process, especially for students of secondary schools from grade 9 to grade 11. These results agree with Ellis, who argued for the merit of "focus on form" in communicative contexts[1]. Likewise, the success of Themez-based instruction confirms Nation and Newton's prediction that meaningful input in authentic situations supports grammar learning through triggering several cognitive routes[2].

DISCUSSION

Another significant implication relates to the role of technology to enhance learner autonomy and metacognition. Grammarly, in this instance, allowed learners to proofread and correct their own grammatical errors, thus transforming the process of feedback from teacher-led to learner-led. This concurs with Vygotsky's Zone of Proximal Development (ZPD), as the software served as a scaffold, helping learners to perform more than their current ability with timely support[3]. LanguageLab's gamified and adaptive architecture also increased motivation, especially among low-achieving students. In line with Deci and Ryan's Self-Determination Theory (1985), learners who feel competence and control of learning are more likely to engage with the material intensely and continue

on challenging tasks. The students' feedback attests to the above theory, as it captures a sense of achievement and ownership of learning. The use of real materials was crucial in bridging the gap between what happened in class and real-life use of language. Themez achieved this by incorporating grammar into socially relevant and age-grade themes such as climate change, digital culture, and health. This approach resonates with Krashen's Input Hypothesis (1982), which emphasizes the need for comprehensible input with a meaningful context in developing natural language. Additionally, the insertion of podcasts, social media conversations, and video transcripts into the grammar book represented students' real life, enabling them to understand grammar as it is more than just an academic requirement. This change in attitude can account for the higher engagement and confidence noted among students. The results of this study point unequivocally to a need for curriculum reform in the teaching of grammar in secondary schools. Reliance on textbooks and drill-and-rule alone cannot be sufficient anymore to provide learners with language use that the outside world requires. Instead, educators need to be encouraged to adopt an integrated approach where the accuracy of explicit instruction is combined with the variety and usefulness of authentic materials and the multimedia potential of new technology. Professional development programs should also include training in the pedagogical use of AI-based tools like Grammarly and structured platforms like LanguageLab. Further, lesson design should also integrate thematic, real-life content through tools like Themez so that learning grammar gets contextualized as well as student-centered.

CONCLUSION

This study has shown that the instruction of grammar in grades 9 through 11 can be significantly assisted by technology and authentic materials integration in the curriculum. The use of LanguageLab, Grammarly, and Themez improved not only grammatical accuracy but also learner engagement, autonomy, and motivation. Through the transition from passive, form-based instruction to interactive, meaningful, and authentic uses of grammar, learners developed a clearer comprehension of language structure and use. The findings validate that grammar is most effectively learned when it is presented in context with immediate feedback and adaptive learning technology. As education systems are coming to be more transformed according to digitalization, teachers, curriculum developers, and policymakers alike need to adopt mixed methods of instruction that respond to learners' demands, style of learning, and the communication needs of the 21st century. Subsequent research needs to consider the long-term effects of such practices and investigate ways that these technologies can be adapted and scaled for mass application in education. Overall, the integration of technology and real-world tools offers a promising pathway toward more effective and interesting instruction in grammar.
