ABSTRACT. This article explores the challenges faced by A1-level language learners in developing speaking skills through the use of tales in the classroom. While storytelling is widely recognized as a powerful pedagogical tool, its effectiveness largely depends on instructional methods. Based on classroom observations, teacher interviews, and a review of relevant linguistic literature, the study identifies key problems such as limited vocabulary, passive learner participation, anxiety about speaking, and teacher-centered storytelling. Drawing on the theoretical frameworks of Krashen’s Affective Filter Hypothesis, Vygotsky’s Zone of Proximal Development, and the communicative methodologies proposed by Uzbek scholars like Jalolov and Ashurov, the article proposes practical strategies for overcoming these barriers. The findings highlight the importance of scaffolding, learner interaction, emotional safety, and culturally relevant materials in facilitating speaking skill development at the beginner level.

Key Words: A1 learners, speaking skills, storytelling, tales, language acquisition, Krashen, Vygotsky, communicative approach, Uzbek folk tales, Jalolov, Ashurov

INTRODUCTION. Speaking is a fundamental component of language proficiency, and its development at the elementary (A1) level is both crucial and challenging. In recent years, educators have explored the integration of storytelling and traditional tales as a tool to enhance learners’ oral communication. Tales are engaging, memorable, and culturally rich, providing authentic contexts for vocabulary and grammar usage. Despite their potential, effectively using tales to develop speaking skills among A1 learners presents specific challenges.

According to Jalolov (2012), developing communicative competence at early stages requires a balanced integration of linguistic input and meaningful output. However, for A1 learners—who typically possess limited vocabulary and basic grammatical knowledge—producing coherent spoken language remains difficult. This article investigates the common problems encountered when using tales to improve speaking skills of A1 learners and suggests pedagogical solutions based on linguistic theory and practice.

METHODS

This article is based on a qualitative analysis of recent studies and classroom observations conducted in several language centers across Uzbekistan between 2022 and 2024. The primary data sources include teacher interviews, learner feedback, and a review of lesson plans incorporating tales into the curriculum. Secondary sources include academic publications from scholars such as Krashen (1982), Vygotsky (1978), and Uzbek methodologists like Jalolov (2012) and Ashurov (2021). The analysis focused on three key variables:

1. Learner engagement with tales
2. Oral language output during and after storytelling
3. Teacher strategies to support speaking development

VOLUME-5, ISSUE-5

1. Limited Lexical Resource. Many A1 learners struggle to retell or discuss tales due to insufficient vocabulary. While tales provide contextualized language, learners often cannot internalize or recall new words quickly enough to produce speech. Jalolov (2012) emphasizes that vocabulary acquisition at the early stages must be closely tied to meaningful communication.

2. Passive Participation. Storytelling sessions often become passive listening tasks, with minimal learner output. Teachers noted that only a small percentage of students attempted to summarize, act out, or respond to stories orally. According to Wright, Betteridge, and Buckby (2005), storytelling must actively involve learners to develop oral fluency.

3. Fear of Making Mistakes Emotional factors like anxiety and fear of speaking inaccurately were frequently observed. This is consistent with Krashen's (1982) Affective Filter Hypothesis.

4. Teacher-Centered Delivery. In many cases, storytelling remained teacher-centered, reducing students' opportunities for creative or spontaneous language use. Ashurov (2021) argues that communicative competence requires interactive, autonomous learning environments.

DISCUSSION

The results confirm that tales have great potential to develop speaking skills, but their impact is often diminished by poor implementation.

Interaction and Scaffolding. Vygotsky's (1978) concept of the Zone of Proximal Development (ZPD) suggests that learners need support (scaffolding) to complete tasks slightly beyond their current ability. Jalolov (2012) emphasizes using structured tasks—such as guided dialogues or sentence frames—especially at the A1 level. From passive listening to active story use to transform tales into effective speaking activities, educators should adopt interactive strategies: retelling stories, sequencing events, performing dialogues, or creating alternative endings (Wright et al., 2005). Cultural Relevance. Incorporating familiar Uzbek tales increased engagement and lowered comprehension barriers. Ashurov (2021) notes that culturally relevant materials foster deeper emotional connection.

Emotional Safety. Creating a low-anxiety environment is essential. Krashen (1982) stresses that emotional safety enables risk-taking in speaking activities.

CONCLUSION

Tales offer rich potential for developing speaking skills at the A1 level, but without intentional planning, their impact remains limited. Common issues include low vocabulary, passive roles, emotional barriers, and teacher-dominated methods. Addressing these requires integrating storytelling with scaffolding, interactive tasks, and emotional support.

Linguistic theories by Krashen, Vygotsky, and local experts like Jalolov and Ashurov reinforce the need for learner-centered, communicative approaches. With proper implementation, tales can become powerful tools in helping A1 learners move from silent listeners to confident speakers.
