DIGITAL ECONOMY AND ITS ROLE IN THE DEVELOPMENT OF SOCIETY

Ahmedov Shohjahon Kahramon oglu - Doctor of Philosophy (PHD) in Economics, Associate Professor of Urgench State University named after Abu Rayhon Beruni

The digital economy is a new modern form of economic management, in which production and a large set of data in digital form as the main factor of management and their re-processing working process serves. Using the obtained results in practice is traditional management allows to achieve much greater efficiency compared to other forms. As an example, different types automatic production processes, 3D technology, cloud technologies, remote providing medical services, production of products with the help of smart technologies and it is possible to mention the processes of delivery, storage of various goods and their sale [1].

The transition to a digital economy means a society based on computers and knowledge we understand building a new type of economy;

With data as key components of the transition to the digital economy mobile social networks, cloud technologies, sensor networks,

Internet of things and artificial intelligence technologies can be cited as examples.

The above-mentioned technologies together create "smart" objects and processes (smart state, smart house, smart city, healthcare, transport, and entrepreneurship).

The digital economy is manifested in: [2]

- This is the creation of new personnel and new jobs
- This is the establishment of a new corporate culture
- This is the emergence of new management and control methods
- This is big data and accuracy
- This is in the creation of artificial intelligence and intelligent management systems
- This is due to the increasing implementation of virtualization processes in education, production and management
- This is in the widespread use of Internet of Things and distance learning (MOOC).
- This is the implementation of the blockchain and various processes carried out through it
- This is the process of May and the possibility of independent business is revealed
- This is the new monetary and credit system and the expansion of banking activities
- It is an ICO (Initial CoinOffering) process that allows you to attract large investments in implementation
- It is an independent currency and cryptocurrencies are introduced into practice
- This is in the development of e-commerce and e-business And other great opportunities are emerging.

The service business is in some sense "default" (unconditionally recognized) digital is becoming a business. On the one hand, no company has ever been in the photo business from film to repeat the fate of Kodak, who inadvertently missed the time to jump to “digital” doesn't want On the other hand, how about Amazon [3]. Uber, Airbnb and others from the digital revolution inventing and implementing completely new schemes of use and business show that it is possible. At first, the Internet was like an online storefront, and later it was like an online magazine Gone are the days when

it was seen as an add-on to an offline business. New to the scene of life Generations - young people who "live" on the Internet, the arrival of business online (“digital”) led to be.

Humanity has entered the era of global changes. Human life in recent times if the main areas of activity were economy and management, science and security, now began to acquire a new form and content. Humanity has become special, which is social leading to changes in relations. Digital technologies have entered our lives to keep going is one of the characteristics of the world of the future [3]. This with advances in microelectronics, information technology, and telecommunications explained. Thus, digitization is an objective, inevitable process, and it is possible to stop it maybe not. One of the most serious risks that accompany digitization is medium and low is the occurrence of mass unemployment among qualified specialties.

The representatives of the middle class are strict may decrease, because it is these jobs that will be automated in the first place, and they will be replaced by intellectual robots [4]. There is enough active, educated, able-bodied population A significant part of them, who are used to a high standard of living, have fallen by the wayside due to the western way of life will come out. However, the digital world is evolving so quickly that it is highly skilled only speeding up the process of training available personnel can prevent their shortage will be. Therefore, for now, whoever is ready for change, there is enough time for it there is time [5]. In the long term, the “digital” (electronic) economy of hard physical workers becoming a tool capable of realizing centuries-old dreams of freedom possible For most people, creativity, science (both fundamental and applied) is wide for art opportunities open up.

The digital revolution is earlier and stronger in some sectors and countries, and others come later and less frequently. Services, media and entertainment the first, followed by telecommunication companies and banks to digitize will be infected. But among the general opinions of analysts and company managers according to the results of the survey, digitization affects all of us to one degree or another does. Today we identify with each essence or belonging to this world we can do, but after a certain period of time, this is the case for most objects we cannot do the distribution. Such examples exist today: the IP camera or any other transmitter connected to the network, what universe is it a part of? There is no doubt that they are phenomena of both worlds the essence is counted. Today, mobile phones store a lot of information: phone numbers, stores birthday information, photos, passwords, and other information [6]. Although we are not even physically connected to the phone, we are functionally one with it we feel whole. The process of merging the real and virtual worlds has begun and It doesn't take a lot of courage to say you can't stop.

As a result of the merger of the real and virtual worlds, a new hybrid world is created, and we are in it different laws and regulations that are different from the laws and regulations that are common nowadays apply. From this point of view, it can be said that it will be separated from the rest of the economy There is no "digital" economy: "Digital" (electronic) economy is in the conditions of the hybrid world is the existing economy. A hybrid world is a virtual world where all "life" is connected to the real world real and virtual, distinguished by the possibility of performing significant" actions is the result of the union of worlds. Information and communication technologies (ICT) for this process low cost, high efficiency and openness of digital infrastructure are prerequisites [7].

Digital business is a new business model that combines the physical and digital worlds is to appear. Schoolof Managementesa defines the digital transformation as "enterprise value and as the use of modern technologies to radically increase productivity describes. Social networks, smartphone market, broadband internet connection, machine learning The "explosive" growth of technologies and

artificial intelligence is changing the world in which companies operate will change it. They are either occupying new market vacancies or existing vacancies they will have to adapt to changes by changing places. Organizations the process of digital transformation - the development of new information technologies and the whole world It is a response to the active spread throughout. Reaching different levels of digital transformation, they The difference between two terms is the difference between "digitalization" and "digitization". has the same meaning as Digitalization is the transfer of information from physical media transfer to digital media [8].

Examples of digitalization are e-books, video courses, making a digital copy of a photo, etc. In this case, the information structure will not change: it will only have an electronic form. Digital view often involves improving the existing business model and optimizing business processes. Digitalization means completely new products in digital form is to create. For example, a dynamic learning course with multiplication or interactive document interpretation system is digitization. The quality of the product created on the basis of digitization is serious cannot be transferred to technical media without loss, so digitization. As opposed to digitalization, there is a noticeable dramatic change in business and allows to gain new competitive advantages [9].
