GREEN CREDITS IN UZBEKISTAN: STATUS, OPPORTUNITIES, AND CHALLENGES

Pulatova S.V
(PhD student of TSUE)

Abstract

This article examines the emergence and development of green credits in Uzbekistan as an important tool for promoting sustainable economic growth and environmental protection. The research evaluates the current landscape, identifies challenges, and proposes practical recommendations for expanding the role of green credit in the national economy.

Keywords: green credits, Uzbekistan, sustainable finance, banking sector, renewable energy, environmental policy

Introduction

Methods

This study utilizes a qualitative and quantitative approach.
- Desk research: Analysis of regulatory documents, government strategies (such as the Strategy for the Transition to a Green Economy 2019–2030), annual reports from leading banks (Agrobank, Asaka Bank, SQB), and project documentation from international development partners (World Bank, ADB, EBRD,UNDP,GGGI).
- Interviews and news review: Examination of policy updates, pilot project announcements, and expert commentaries from banking and finance officials in 2022–2024.
- Statistical review: Evaluation of public data on the volume of green credit issued, sectoral distribution, and comparative analysis with regional benchmarks.

Results

Green credit portfolio size: In 2023, the green credit portfolio of Uzbek commercial banks surpassed UZS 1.2 trillion, up from about UZS 400 billion in 2021. Major recipients included renewable energy (solar panel installations), agricultural modernization, and energy-efficient equipment for SMEs.
Leading banks and partnerships: Agrobank, SQB, and Asaka Bank launched dedicated green credit lines in partnership with international organizations such as the EBRD, ADB, and GGGI. For instance, Agrobank's green lending reached over UZS 350 billion in 2023, supporting over 4,000 micro and small businesses in acquiring solar, biogas, and drip irrigation systems.
Sectoral focus: Renewable energy (loans for rooftop solar, small-scale hydro, biogas), Agriculture (drip irrigation, low-emission tractors, organic farming), and Energy efficiency (LED lighting, insulation, modern machinery).
Regulatory support: In 2022, the Central Bank of Uzbekistan introduced guidelines for green lending, setting eligibility criteria and reporting requirements. Government incentives included partial interest subsidies and risk-sharing guarantees for banks expanding green portfolios.

Discussion

Despite positive trends, the green credit market in Uzbekistan faces notable challenges:
- Awareness and capacity: Many entrepreneurs and households lack information on green finance benefits or available products.
- Project bankability: Small and medium businesses often have difficulty preparing quality project

proposals and meeting collateral requirements.
- Limited long-term funding: Most green credit lines are dependent on international partner funding; local long-term financing is underdeveloped.
- Regulatory gaps: While new guidelines exist, further alignment with international green taxonomy and clearer impact assessment methods are needed.

1.Green Credit Portfolio Growth

The green credit portfolio in Uzbekistan has demonstrated remarkable growth from 2021 to 2023. In 2021, the portfolio stood at 400 billion UZS, nearly doubling to 750 billion UZS in 2022, and then rising to 1.2 trillion UZS in 2023. This threefold increase over three years reflects a strong policy focus on sustainable finance and growing interest among banks and international development partners. The consistent upward trend indicates that government strategies and incentives for green lending are yielding tangible results. Rapid expansion in this market also suggests that businesses and households are becoming more receptive to sustainable financial products.

2. Sectoral Distribution of Green Credits

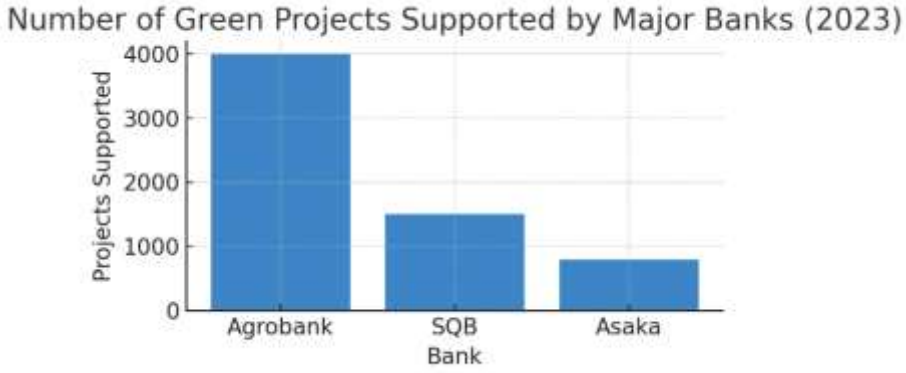

The sectoral allocation of green credits in 2023 reveals that renewable energy is the primary beneficiary, receiving about 40% of total green lending. This is followed by agriculture at 35%, which includes support for efficient irrigation, eco-friendly equipment, and modernization projects. Energy efficiency accounts for the remaining 25%, highlighting increased investment in manufacturing upgrades, building insulation, and efficient lighting. This distribution indicates that Uzbek banks and policymakers are prioritizing both climate action (through renewable energy) and resource-efficient agricultural transformation, which is vital for the country's food security and rural livelihoods.

3. Number of Projects Supported by Major Banks

Among commercial banks, Agrobank leads by a wide margin, supporting around 4,000 green projects in 2023. SQB follows with 1,500 projects, while Asaka Bank supported approximately 800 projects. The high project count for Agrobank can be attributed to its deep involvement in rural finance, partnerships with international institutions, and active role in government green initiatives. The growing number of projects supported by multiple banks indicates increasing competition, as well as broader adoption of green lending practices across the financial sector. It also demonstrates that green credits are reaching micro, small, and medium enterprises as well as individual entrepreneurs.

The Uzbek green credit market is expanding rapidly, driven primarily by renewable energy and sustainable agriculture. The government's incentives, international partnerships, and proactive banking sector are accelerating this growth. However, continued development will require further diversification of credit products, deeper financial market infrastructure, and ongoing education for borrowers and financial institutions. With sustained efforts, green credits will play a critical role in Uzbekistan's transition to a low-carbon and resilient economy.

However, the foundations are strong. Government support, growing international collaboration, and the success of pilot programs signal high potential for market expansion. Improved marketing, training for bank staff, and the development of standardized 'green loan' products can accelerate growth. Establishing a national green credit registry and regular reporting would also boost transparency and investor confidence.

Conclusion

Green credits are becoming an increasingly important part of Uzbekistan's sustainable development strategy. Although the market is young and faces obstacles, recent reforms, pilot projects, and international partnerships demonstrate a strong basis for growth. Scaling up green credit offerings and improving supporting infrastructure will help Uzbekistan achieve its environmental and climate goals, foster innovation in banking, and strengthen economic resilience.
