THE INFLUENCE OF NATIONAL CHARACTERISTICS OF FAMILY EDUCATION ON THE CHILD'S PERSONALITY

Jiyenbaeva Zibagul Rasulovna

1st year master of NSPI named after Ajiniyaz

Abstract. This article explores how national characteristics and cultural traditions within family education influence the formation of a child's personality. Drawing from interdisciplinary research in psychology, pedagogy, and cultural studies, it examines the impact of national values, parenting styles, gender roles, authority structures, and communication models as shaped by cultural identity. The study argues that while globalization introduces universal trends in parenting, national traditions continue to serve as powerful determinants of a child's social behavior, emotional development, self-identity, and worldview.

Keywords: family education, child development, national characteristics, cultural identity, parenting, personality formation.

INTRODUCTION

Family is the first social institution through which a child experiences the world. It is within the family that core values, emotional models, behavioral patterns, and identity markers are first learned and internalized. While many psychological theories highlight the role of individual parenting styles and attachment in child development, there is growing recognition that national and cultural characteristics of family education play an equally crucial role in shaping a child's personality. These characteristics reflect historically rooted value systems, religious beliefs, traditions, and social structures that define not only how children are raised, but also how they are expected to function within society.

In today's increasingly globalized environment, family education is at the crossroads of tradition and modernity. As international parenting ideals—such as autonomy, open dialogue, and emotional intelligence—gain popularity, they often intersect, blend, or even conflict with long-standing national practices. Understanding how these national characteristics influence child development is essential for educators, psychologists, and policy-makers seeking to support healthy personality formation.

MATERIALS AND METHODS

Each nation instills in its children a set of cultural values and moral expectations that reflect collective identity. For example, in many Eastern cultures—including Uzbekistan, Japan, and China—family education is strongly influenced by collectivist ideals. Children are taught to prioritize group harmony, filial piety, and respect for elders. In such contexts, humility, self-restraint, and obedience are seen as virtues, and parental authority is rarely questioned. These values shape children into socially cooperative and emotionally restrained individuals who value duty and communal responsibility.

In contrast, many Western cultures—such as those in the United States and Northern Europe—emphasize individualism, personal freedom, and self-expression. Parents are more likely to encourage critical thinking, personal choice, and emotional openness. This approach fosters children who are independent, confident, and assertive. Thus, a child's moral reasoning and behavior are often rooted not merely in personal temperament or parental style, but in the overarching national moral philosophy.

RESULTS AND DISCUSSION

National culture deeply influences how authority is perceived and exercised within the family. In patriarchal societies, traditional gender roles are often emphasized, with fathers occupying the position of decision-maker and mothers as nurturers. In such contexts, the child's concept of hierarchy, gender identity, and discipline becomes shaped accordingly. This model can produce respectful and law-abiding personalities, but in some cases may suppress creativity, initiative, or gender equality.

Alternatively, in societies with more egalitarian or democratic family structures, children are encouraged to negotiate, express their opinions, and participate in family decisions. While this promotes confidence and emotional expression, it may also lead to a diluted sense of hierarchical boundaries, which can present challenges in societies where age-based respect remains culturally significant.

The way emotions are expressed and regulated within a family is also culturally mediated. In some cultures, such as Scandinavian countries, children are encouraged to verbalize feelings and discuss their inner experiences openly. In others—particularly in traditional Central Asian, South Asian, or Middle Eastern households—emotional restraint is promoted as a sign of strength and maturity. Children growing up in emotionally reserved environments may develop high levels of self-control and respect for social norms, but may also face difficulties with emotional literacy or mental health communication later in life.

Furthermore, the use of non-verbal communication—such as touch, facial expressions, and proximity—also varies by culture and has a profound effect on how children perceive intimacy, empathy, and conflict resolution. These communicative frameworks eventually influence the child's own interpersonal behavior and ability to form social bonds.

In many nations, family education is inseparable from academic achievement. Countries like South Korea, China, and Russia have educational systems where family honor is tied to scholastic success. From an early age, children are taught discipline, time management, and high achievement goals. While this may cultivate ambition, perseverance, and respect for learning, excessive pressure can also lead to anxiety, burnout, and fear of failure.

In contrast, some Western educational cultures promote experiential learning and holistic development. Parents may value curiosity, collaboration, and emotional development over test scores. These national attitudes shape not only the child's academic identity but also their broader worldview regarding success, failure, and lifelong learning.

Religious traditions embedded in national culture often play a critical role in family education. They define ethical boundaries, prescribe behavioral norms, and provide rituals that structure a child's life—from birth ceremonies to rites of passage. For instance, in Islamic contexts, practices like daily prayer, fasting, and community service are introduced early, reinforcing discipline and moral accountability. Similarly, Christian or Buddhist family structures may emphasize forgiveness, compassion, or mindfulness [1].

These religious and cultural rituals help children form a coherent sense of identity, giving them belonging and purpose. However, in increasingly secular or pluralistic societies, intergenerational conflict may arise when children are exposed to divergent value systems through media or schooling.

In multicultural and diasporic contexts, family education becomes a negotiation between heritage and host culture. Migrant families often strive to preserve national values while simultaneously adapting to new societal norms. Children in such settings may develop bicultural identities, integrating multiple

moral codes and communication styles. While this can lead to cultural fluency and empathy, it may also produce confusion, role conflict, or identity instability if not supported effectively.

Educators and psychologists working with such families must be sensitive to the unique cultural dynamics influencing child behavior and should avoid applying monocultural developmental expectations [2].

Another important yet often underexamined factor in the influence of national family education is the collective memory and historical experience embedded within the educational practices of different cultures. Societies that have undergone colonization, totalitarian rule, or war may pass down family education systems characterized by caution, obedience, conformity, and emotional self-restraint. These traits, developed as survival strategies, often become ingrained as cultural norms in child-rearing.

For example, in post-Soviet societies such as Uzbekistan, family education continues to reflect elements of the Soviet legacy, where discipline, collectivism, respect for authority, and the primacy of the group over the individual were emphasized. Although the current Uzbek society is undergoing a value transformation in line with national independence and modernization, many families still instill in children the virtues of order, duty, and social conformity. This is reflected in the tendency to discourage open disagreement, promote academic excellence as a family duty, and uphold strong intergenerational loyalty. These cultural imprints shape the child's worldview—producing personalities that value structure, hierarchy, and social roles, while at times inhibiting critical thinking or emotional openness [3].

Furthermore, national identity is often transmitted through language and storytelling within the home, which significantly contributes to the development of personal identity and worldview in children. In cultures where oral traditions, folklore, and epic poetry are common, such as among Turkic and Central Asian peoples, children are raised with strong narrative frameworks about honor, sacrifice, courage, and community belonging. These stories do not only serve as entertainment but act as vehicles for moral and behavioral modeling. Children who internalize these culturally specific archetypes may grow up with a strong sense of purpose and pride, particularly in relation to ethnic and national heritage [4].

Conversely, in societies where individuality and self-authorship are emphasized, children are often encouraged to construct personal narratives based on self-discovery and unique talents. This reflects in the formation of an independent identity structure, where the child is seen as an agent of change rather than a bearer of tradition. While both approaches shape character development, the national context determines whether personality evolves toward social adaptation or individual self-realization.

The national family education system also plays a major role in the formation of gender identity and future gender roles. In traditional cultures, clearly defined roles for boys and girls are introduced early. For example, in many Muslim-majority or patriarchal societies, girls may be raised to embody modesty, obedience, and family responsibility, while boys are trained for leadership, protection, and financial provision. These expectations directly shape personality traits such as assertiveness, nurturance, emotional expression, and even academic ambition [5].

CONCLUSION

National characteristics of family education play a vital role in shaping the emotional, social, and moral aspects of a child's personality. While global trends introduce new parenting models and values, deeply rooted cultural traditions continue to guide how children are nurtured, disciplined, and

prepared for society. Recognizing these influences is crucial not only for parents but also for educators, counselors, and policymakers who aim to support child development in culturally respectful and effective ways. A nuanced understanding of national family education allows for more inclusive psychological approaches that honor diversity while promoting the universal goals of well-being and personal growth.
