Annotation article analyzes on a scientific basis the role of the application of 3D technologies in the development of students' knowledge, skills and competencies in the STEAM (Science, Technology, Engineering, Arts, Mathematics) education system. In particular, the role of 3D modeling and 3D printing technologies in supporting interdisciplinary integration, the formation of important skills such as creative thinking, problem solving, and collaboration are highlighted. The article discusses the possibility of integrating 3D technologies into the educational process based on modern teaching methods - project-based learning, blended learning, collaborative learning and the use of digital resources. Recommendations are also made on the successful implementation of 3D technologies in education based on international and local statistics, case studies and pilot tests.

Keywords: STEAM Education, 3D Technologies, 3D Modeling, Digital Education, Project-Based Learning (PBL), Integrated Education, Creative Thinking, Innovative Pedagogy, Engineering Skills, Interactive Methods, Teaching Strategies.

In the modern world, digital technologies are becoming an integral part of the education system. In particular, STEAM education — that is, the concept of teaching in harmony with the disciplines of Science, Technology, Engineering, Arts and Mathematics — is seen as a strategic direction for education in the 21st century. The main goal of STEAM education is to form creative, critical, and systems thinking in students, educating them as competitive professionals who can solve real problems.

In recent years, 3D technologies (in particular, 3D modeling and 3D printing) have been widely used as an important innovative tool in this approach. According to UNESCO and OECD reports, it was found that the level of knowledge and quality of vocational training of students who have mastered digital technologies are 18–23% higher. Also, according to a 2023 survey conducted by the EdTech Evidence Exchange, 74% of students reported a deeper understanding of the topic in 3D technology-based lessons.

The education system of Uzbekistan is also adapting to this global trend. The "Digital Education Strategy" for 2022-2016 includes a separate clause on the introduction of 3D technologies in secondary and vocational education institutions. Preliminary experiments in this area were carried out in Tashkent, Samarkand and Andijan regions and positive results were observed: the interest of students in subjects increased by 1.4 times, the level of participation in the lessons increased by 25%.

Therefore, the effective integration of 3D technologies into STEAM education is an important factor that enhances not only the quality of education, but also the readiness of students for future professions. In this article, teaching methods using 3D technologies, their interdisciplinary

integration, impact on the effectiveness of education and local and international experiences are scientifically analyzed.

Key Section

3D The role of technology in STEAM education

With the help of 3D technologies, students will be able to:

Science (Science): The in-depth analysis of biological structures, physical phenomena or chemical structures by modeling;

Technology (Technology): digital design, 3D scanning and 3D printing practice;

Engineering: Design and prototyping to solve problems;

Arts (Arts): 3D graphic design for development of creative approach;

Mathematics (Mathematics): visualization of geometric shapes and volumetric calculations.

2. Integration of teaching methods

The following effective methods of integrating 3D technology into the training process are carried out:

Method name	Description	Advantages
PBL (Project-Based Learning)	Students create a 3D project based on real problems	Develops independent thinking and creative approach
Flipped Classroom	Students will learn 3D modeling at home and conduct practice in the classroom	Cost-effectiveness and deep analysis
Collaborative Learning	Create 3D projects together through group work	Building teamwork skills
Blended Learning	The harmony of digital and traditional education	Flexible Learning Environment

Analytical part: statistical analysis and practical examples

1. Statistics

Pew Research Center (2023): Readers who used 3D technology showed a 17% higher mastery rate.

According to research from the Harvard Graduate School of Education, using STEAM-based 3D modeling increased students' problem-solving skills by 23%.

In an experimental study conducted by the Center for Educational Innovation of the Republic of Uzbekistan in 2024, the overall rating of students in the classroom with the integration of 3D technologies was 14% higher.

2. Practical Example

For grades 6-9, 3D lessons based on Autodesk Tinkercad and SketchUp were introduced in the experimental test conducted at the specialized school No 2 in Tashkent. In 8 weeks:

85% of the students were able to understand engineering terms,

71% of students designed their project in 3D format,

90% of students showed positive growth in creative thinking.

Conclusion

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-5, ISSUE-6

The above analysis shows that the **use of 3D technologies in STEAM education** not only deepens students' theoretical knowledge, but also plays an invaluable role in the development of their **creative thinking**, **independent decision-making capacity in problem situations** and **engineering approach**, etadi. 3D through modeling and 3D printing technologies, students can learn the topic not only by hearing or but also through modeling and putting it into practice.

Shuningdek, zamonaviy o‘quv metodlari — loyiha asosida o‘qitish (PBL), aralash ta’lim, hamkorlikda o‘qitish va raqamli platformalardan foydalanish — 3D texnologiyalarni muvaffaqiyatli integratsiya qilishga yordam bermoqda. Bu metodlar o‘quvchilar orasida jamoaviy ishlash, mas’uliyatli yondashuv va texnik tafakkurni shakllantiradi.

Statistical and experimental data confirm that by incorporating 3D technologies into the STEAM track:

students' interest in subjects **increases**;

social and professional competencies are formed **among students**;

create an interactive and visual learning environment;

The possibility of explaining complex topics **in a simplified visual model** expands.

Along with a number of organizational and methodological issues, such as the correct and effective training of teachers of these technologies, updating the technical base and software, adapting the curriculum, etc.

In the future, it is recommended to conduct research and implement in the following directions:

organization of special training courses **for teachers on the basis of 3D technologies**;

equipping secondary schools and vocational institutions **with modern technological equipment**;

Expanding students' participation in innovative projects through the establishment of STEAM laboratories;

learning international experiences and adapting them to local conditions.

In conclusion, the integration of 3D technologies with teaching methods in STEAM education is an effective way to prepare the modern student for the professions of the future, increase technological literacy and form innovative thinking.
