Prospective directions for enhancing regional competitiveness through increased innovation activity

Azimov B.F. – Associate Professor, Asia International University
Amonov Z.M. – Senior Lecturer, Bukhara State Technical University

Abstract: This article provides a scientific analysis of enhancing regional competitiveness through increasing innovation activity. It explores the historical impact of innovation on regional economies, current reforms in Uzbekistan, and future strategic priorities. Particular attention is given to the formation of innovation infrastructure, public-private partnerships, scientific capacity development, and the role of technoparks in creating regional competitive advantages. The study includes statistical data, open-access sources, and analyses from international organizations to support its conclusions.

Keywords: innovation activity, regional competitiveness, technoparks, scientific capacity, Industry 4.0, innovation infrastructure, sustainable development

Considering innovations as a driving force of the economy plays a decisive role in creating a competitive environment and ensuring the economic growth of regions. In today's globalized world, regions are competing not only based on their natural resources or demographic advantages but also on their innovative capacity. Currently, innovation activity is not only a measure of introducing technological novelties but also a key indicator in modernizing the socio-economic structure of regional economies.

When analyzing the historical development of innovation activity, it becomes evident that scientific and technical progress initiated by industrial revolutions had a significant impact on regional development. During the First Industrial Revolution in the 19th century, the invention of steam engines, textile machines, and railways led to the formation of production hubs and accelerated urbanization. These areas became centers for labor, scientific experience, and capital accumulation. The Second Industrial Revolution (electrification, conveyor systems) and the Third Industrial Revolution (information technologies) shaped inter-regional competition not only through resources but also through innovation-based economic growth. During these eras, countries like Japan, Germany, and the United States secured leading positions by forming regional innovation clusters[1]. Although innovation activity in Uzbekistan developed slowly after gaining independence, it has entered a new phase in the last decade. Notably, the Ministry of Innovative Development was established in 2018, marking a shift of innovation policy to the state level[2]. Since 2019, the annual "InnoWeek" international innovation week has been held. More than 10 technoparks have been established since 2020, mainly in Tashkent city, Fergana, and Samarkand regions. According to current statistical data, by 2024 the number of registered innovation projects has exceeded 1,800, with 65% implemented by the private sector[3]. Based on scientific activity indices, the funds allocated for

research by higher education institutions have increased yearly — from 457 billion UZS in 2021 to 1.2 trillion UZS in 2024[4].

The future trends show that the global economy is entering the era of the "Fourth Industrial Revolution" (Industry 4.0), where artificial intelligence, robotics, biotechnology, blockchain, quantum computing, and the Internet of Things (IoT) play a central role. This transformation binds regional competitiveness not to resources, but to knowledge-based economies. Uzbekistan's strategic goals in this regard include improving intellectual property protection mechanisms, developing startup ecosystems, creating mechanisms for exporting local innovative products, and expanding STEM education for training innovation-oriented personnel[5].

According to the World Economic Forum, by 2030, it is expected that 60% of global innovation capacity will shift from metropolitan centers to regional and local incubation hubs [6]. This necessitates a reassessment of Uzbekistan's regional innovation policy and full mobilization of the capacities in different provinces. For instance, in the agro-industrial sector, regions such as Navoi, Kashkadarya, and Syrdarya, and in tourism, Khorezm and Bukhara, possess enormous potential for innovative solutions.

International experience shows that the most competitive regions are those that have successfully integrated science and production. For example, certain regions of South Korea, Finland, and Germany occupy leading positions in high-tech services and export-oriented production through the implementation of innovation clusters[7]. In countries scoring highest on the UN's Global Innovation Index, regional policies and economic reforms have been effectively directed toward fostering innovation.

Analyzing the case of Uzbekistan, it is evident that reforms in the field of innovation have been systematic and consistently implemented in recent years. The Development Strategy of New Uzbekistan for 2022–2026 places special emphasis on the advancement of innovations. In particular, the strategy outlines strengthening the linkages between education, science, and industry; establishing new technology centers; and modernizing research and production infrastructure[8].

Institutions such as the Agency for Innovative Development, international Inno fairs, and structures like TechnoPark contribute to the formation of innovation ecosystems at the regional level. According to the State Committee on Statistics, by the end of 2024, the share of R&D in Uzbekistan's GDP has reached 0.5%, whereas in developed countries this figure ranges from 2.5% to 3%[9]. This indicates that there is still significant untapped potential for enhancing innovation activity in the country.

At the same time, disparities remain between regions. For example, while Tashkent city and region host a relatively higher concentration of research institutions and technoparks, the Republic of Karakalpakstan and certain western provinces lag behind. This suggests the need for targeted mechanisms to eliminate regional innovation imbalances.

In the future, enhancing regional competitiveness will depend heavily on the following directions: first, effective utilization of scientific potential through integration of higher education institutions and research centers in the form of clusters; second, institutionalization of mechanisms for supporting innovative projects by local authorities; third, expanding business incubators and startup platforms, including special grant programs for women and youth; and fourth, developing innovation ecosystems based on digital transformation.

According to the World Bank, increasing competitiveness requires understanding innovation not only as technological novelty but also as improvements in organizational, marketing, and managerial practices[10]. In Uzbekistan, examples of such innovations can be found in the agricultural sector, where "smart farming" is being introduced, in tourism with the development of digital platforms, and in education with hybrid learning models. Notably, the "IT Park" in Samarkand region and the "Smart Agriculture" project in Bukhara region are among the first exemplary initiatives in this regard.

In conclusion, ensuring the competitiveness of regions is inextricably linked to enhancing innovation activity. This process requires the involvement not only of the state, but also of the private sector, civil society, and educational institutions. Strengthening the scientific and innovation infrastructure, protecting intellectual property rights, and expanding financial instruments will contribute to stable and dynamic regional development.
