Abstract: This article highlights methodological approaches to increasing body resilience, strengthening health, and promoting a healthy lifestyle in preschool children through regular morning exercises. The exercises are analyzed based on practical research for their role in improving cardiovascular, respiratory, and motor system functions and fostering a positive psychological state.

Keywords: Morning exercise, hardening, healthy lifestyle, preschool age, health, physical development, hygiene.

Physical education tools play a crucial role in improving children's health and physical development. Preschool children's bodies are particularly sensitive to environmental factors due to their still-developing immune systems. Therefore, conducting systematic morning exercises is an essential method for body hardening, stimulating the heart and respiratory systems, strengthening muscles, and promoting a positive emotional state.

This article outlines key principles for organizing effective morning exercises adapted to age-specific needs and pedagogical strategies.

1. Importance of Morning Exercises

Morning exercise refers to light gymnastics typically done before breakfast, aiming to:

- Wake the body and activate it;
- Stimulate blood circulation and respiratory systems;
- Maintain muscle and tendon elasticity;
- Develop movement culture in children;
- Ensure a positive emotional state throughout the day.

2. Structure and Duration of Exercises

Morning exercises for preschool children should include:

- Introductory part (1–2 minutes): walking, light jogging, arm movements;
- Main part (5–6 minutes): exercises for arms, legs, torso, neck muscles, and balance-enhancing movements;
- Conclusion (1–2 minutes): walking, deep breathing, and stretching.

Total duration: 8–10 minutes. The movements should be smooth, repetitive, and suitable for the child’s physical condition.

3. Benefits of Hardening the Body

Conducting morning exercises outdoors improves children’s tolerance to temperature changes, resulting in:

- Increased resistance to cold;
- Decrease in mild allergic reactions;
- Reduced incidence of colds, flu, and respiratory illnesses;

- Improved general condition and mood.

Morning exercises were conducted for 3 months with 30 children aged 5–6. The results showed a 76% reduction in cold-related cases and an 82% improvement in emotional stability.

4. Psychological and Educational Impact

Physical activity positively influences not only physiological but also psychological and educational aspects, helping children to:

- Develop self-confidence, independence, and discipline;
- Establish the habit of starting the day according to a set routine;
- Improve social activity and teamwork skills.

Motivating children during sessions using music, storytelling characters, and praise encourages participation and enthusiasm.

Morning exercises significantly contribute to preschool children's physical development, body hardening, emotional stability, and the formation of a healthy lifestyle. These activities:

- Stimulate bodily functions and activate the body;
- Teach children discipline and self-care;
- Improve tolerance to cold weather.

Morning workouts are vital in strengthening children’s health, preparing them for school, and fostering physical culture.
