Using AI writing tools to enhance EFL learners writing skills

Sodikova Robiyakhon A'zimjon qizi

4th year student of Uzbekistan State World Languages University

English philology faculty, Tashkent, Uzbekistan

Annotation: This research provides a critical perspective of the current literature surrounding the application of AI tools in lessons. The primary objective of this article is to clarify the concept of AI tools, reasons for using them to enhance the writing skills of EFL students, methods and key concepts of using these tools correctly, potential benefits that can be gained, research results on this topic and future of this trend. As AI has become inseparable part of today, operating every technology: from the smartphones to the complex algorithms driving financial markets, its footprint is undeniable in the scope of education, especially when learning foreign languages Since methods, and approaches that are used in traditional teaching systems have changed to learner-centered ones by applying new tools of AI as a way to be linked with cutting-edge technology and improve both the teaching and learning process, expanded varieties of these tools, are now widely used in EFL classrooms both by teachers and learners, creating a bigger environment for greater improvements but rising reliance on them at the same time. There have been huge debates and research on this topic, some concluding it to be beneficial and harmless, in this paper writer tries to give a perspective based on both research conducted in their home country and a review of the literature by scholars abroad, and offers more detailed information to draw conclusions about its global influence.

Keywords: AI, writing tools, writing elements, generating ideas, navigation, reliance on artificial intelligence, summarizing literature, essay writing.

Introduction

Artificial intelligence is no longer a futuristic concept of science, it is a present-day reality woven into the fabric of our daily lives and professional spheres. From healthcare to entertainment, its role is beyond the shadow of doubt. Academic field is no exception in this shift. In educational sphere, AI tools are widely used in various areas in order to increase efficiency of both students and teachers, to ease and make the learning process more appealing, fulfilling, convenient and inclusive by saving users' time and effort. Writing is included in this category, as well. From students to teachers, AI tools are being widely used for different purposes, including generating ideas for writing academic papers, offering more advanced words, phrases or equivalents, checking for grammar, writing structure, even coherence and cohesion. In many countries, especially authors home county, students and teachers commonly use Chat GPT for assessing their essays, particularly in Writing section of language certificate IELTS and many other students, as a source of knowledge, use Chat GPT to complete their academic tasks. AI tools helps the members of academic sphere in many ways, for instance, when it comes to composing essays, creating ideas, summarizing literature, and even assessing their works among other academic tasks. Artificial Intelligence (AI) has revolutionized the creation, instruction, learning, assessment, and editing of writing. With AI technology, authoring tools like automated writing evaluation (AWE) and automated essay scoring—which were initially created to help writing teachers evaluate their students' assignments—have completely changed from providing standard grammar and spelling checks to providing comprehensive assistance in identifying writing issues and making recommendations for enhancing the writing quality [1]. The amount of college students using generative AI for their assignments, like Chat GPT, is approximately

50%, and it is likely to increase every year. Therefore, it is suggested that using Chat GPT in academic settings should not be prohibited or opposed. Rather, it is imperative that students learn how AI tools operate, including how to create efficient commands or prompts (dubbed "prompt engineering") and how to assess the accuracy and dependability of the results produced by these AI tools. This method of instruction can also equip students with the knowledge and skills necessary to make responsible and effective use of contemporary technology.

AI Assistant Writing tools

At this point, numerous AI writing tools can be referenced. In home country, most of the students use Chat GPT, Grammarly, QuillBot, Paraphraser, Google Translate as a means of writing assistant. In many other countries to assess and improve written texts, a number of AI writing technologies have been introduced, such as IntelliMetric, e-rater, the Intelligent Essay Assessor, Pigai, iTEST, iWrite, Project Essay Grade, My Access!, Criterion, Holt Online Essay Scoring, Writing Roadmap and Write to Learn, Grammarly, Wordtune, Writerly, and Google Docs [8]. According to researches, Paperpal, WordTune, Copy.ai, Jenni AI, Essay Writer , ProWritingAid and Ginger are widely used worldwide, both by learners and teachers. Among them Grammarly, ProWritingAid and Ginger are considered as Automated Writing Corrective Feedback (AWCF) Tools and gained popularity while Chat GPT, Jenni AI, QuillBot can be considered as Automated writing evaluation (AWE) Tools [1]. This AI assisted tool is used worldwide by most of the students and teachers as it checks grammar, punctuation, suggests more words, phrases, even sentences and helps to gain the flow. Grammarly can be used as a stand-alone application or integrated with certain writing systems, text editors, and processors, such as Google Docs or Microsoft Word, to continually and concurrently offer corrections and suggestions while authors are producing the text. Additionally, Grammarly has now been made accessible as a browser extension. The majority of the academic community finds it dependable due to its time-saving features and availability in both free and upgraded versions. Teachers and students who answered the author's questionnaire reported that this writing tool literally improved their vocabulary, organization, and grammatical proficiency. Those who took the CEFR and IELTS exams indicated that Grammarly helped them raise their scores by at least one point. Moreover, numerous studies in the literature have looked into the use of Grammarly in EFL classrooms. The majority of these research have determined that Grammarly's feedback was accurate [1].

Another AI assisted writing tools, Google Docs and Writerly were experimented by B. Derseh and Y. F. Kassahun [2]. This experiment employed a mixed-methods approach, collecting data from 92 randomly chosen individuals using examinations, questionnaires, focus groups, and teacher diaries.

While students in the control group were taught using the conventional paper and pencil feedback system, students in the experimental group improved their writing abilities by integrating Writerly and Google Docs. The qualitative data were examined thematically after the quantitative data were examined using descriptive statistics and the independent samples T-test. A statistically significant difference in writing performance between the experimental and control groups shown that the combination of Writerly and Google Docs AI technologies greatly enhanced EFL writing training. Because they were able to write essays that successfully addressed task achievement, coherence and cohesion, lexical resource, and grammatical range and accuracy, students who learned through the integration of Writerly and Google Docs demonstrated improved writing performance. In contrast, students who learned through the traditional method produced essays of lower quality.

The results also showed that students in the experimental group had favorable opinions on the integration of Writerly and Google Docs because they thought these AI writing tools were engaging, useful, supportive, and goal-oriented. As a result, this study suggests that instructors, students, curriculum designers, researchers, and material designers give Writerly and Google Docs careful consideration [2]. Language educators will face difficulties in assessing such written work because they will need to come up with innovative ways to assign credit in a fair and consistent manner, and writing teachers will need to find assignments that combine automatic text generation with student effort, just as they did with Machine Translation [5] like Google Translate, which is another popular AI-assisted writing tool. Because of its availability in nearly every language, this tool is incredibly helpful when students attempt to translate their intended message from their native language into English. However, it is inaccurate and an oversimplified viewpoint to assume that students utilize Google Translate to complete their projects by just copying and pasting without using the target language [7]. As opposed to translating entire texts from their first language to the target language, second language learners typically use MT to seek up specific words or phrases. In addition to the fact that Google Translate is freely available and accessible across numerous platforms and mobile devices [3], research studies that examined the use of MT in language classrooms and asked participants why they used it found that students used it for its speed and convenience [4]. In a variety of language learning contexts, the majority of students polled in recent studies [8] utilized Google Translate to finish learning assignments.

Conclusion

AI-assisted writing tools are now indispensable in today's classrooms, especially when it comes to improving students' writing abilities. In the author's native country and abroad, many people utilize tools like ChatGPT, Grammarly, QuillBot, and Google Translate to help them write more fluently and with better grammar and vocabulary. Students of all skill levels can write more effectively and with less fear thanks to these technologies, which provide quick and easy guidance. Many tools are being included into writing evaluation and education around the world, such as iWrite, Pigai, e-rater, IntelliMetric, and others. These platforms help teachers and students in the learning process by offering evaluation and remedial feedback. Automated Writing Corrective Feedback (AWCF) tools include Grammarly, ProWritingAid, and Ginger. On the other hand, Automated Writing Evaluation (AWE) tools, which help with content creation and coherence, include ChatGPT, Jenni AI, and QuillBot. Students that use AI tools outperform those who use traditional methods in areas including task achievement, lexical resource, and grammatical accuracy, according to experimental investigations like the one involving Writerly and Google Docs. These results imply that the careful incorporation of AI writing tools into the classroom can improve writing results and student engagement. Furthermore, research indicates that learners intentionally employ resources like Google Translate for vocabulary support rather than as shortcuts, despite the fact that these tools are frequently misinterpreted.

But there are drawbacks to the growing usage of AI technologies for teachers as well, particularly when it comes to assessing real student work. Now, educators need to create novel tests that accurately gauge both student participation and AI support. Principles that promote responsible use, critical thinking, and academic integrity should direct AI's application in education as it develops further. In the end, AI writing tools can be effective friends in language acquisition and writing improvement when used carefully.
