Abstract

This article explores the significance of strong partnerships between parents and teachers in the context of inclusive education. Drawing on recent studies and real-life practices, it highlights practical strategies for fostering collaboration that benefits students with diverse educational needs. Examples from international contexts and recent data illustrate how effective parent-teacher partnerships contribute to inclusive learning environments. The paper also discusses existing challenges and suggests ways to overcome them to ensure meaningful participation of families in the inclusive education process.

Key words: Inclusive education, parent-teacher collaboration, family engagement, special educational needs, partnership building

In recent years, the movement towards inclusive education has become stronger worldwide. Many countries have developed policies that aim to integrate children with different abilities into mainstream schools (UNESCO, 2020). However, policies alone are not enough. Successful inclusive education depends largely on how teachers and parents work together to support children's learning and development (Benson and Padilla, 2023). Building strong parent-teacher partnerships is therefore a critical element of creating inclusive schools where every child can feel valued and supported.

Research shows that parental involvement improves academic performance and social skills of all students, including those with special educational needs (Garbacz et al., 2019). In inclusive settings, where diverse needs require individualized approaches, the role of parents becomes even more important. Parents know their children's strengths, needs, and daily routines better than anyone else. When teachers listen to parents and value their input, they can adapt teaching methods more effectively.

A study by Hornby and Blackwell (2018) found that teachers often feel unprepared to work with parents of children with disabilities. This is particularly true in low- and middle-income countries, where professional development for inclusive practices is still developing. Teachers sometimes see parents as passive receivers of information rather than active partners in their child's education. To change this, schools should encourage open communication from the beginning of the school year. For example, regular parent-teacher meetings and home visits have been found to build trust and mutual respect (Epstein, 2018).

One practical example comes from Finland, where inclusive education is highly developed. Finnish teachers maintain close relationships with families through regular dialogue and shared decision-making (Halinen, 2018). Parents participate in planning Individual Education Plans (IEPs) and can freely discuss any concerns with teachers. Such practices ensure that the school and family are working towards common goals.

Another example is from a project in India, where community-based rehabilitation workers help bridge the gap between schools and families of children with disabilities (Singal and Rouse, 2020). These workers visit families, help them understand school processes, and support teachers to address

individual needs. This collaboration increases school attendance and reduces dropout rates among children with disabilities.

Despite clear benefits, building effective partnerships is not always easy. Parents may lack confidence to approach teachers or feel that their opinions are not valued. Language barriers and cultural differences can also create misunderstandings (Alam and Tapan, 2021). Some families may have negative past experiences with schools and fear being blamed for their child's difficulties. Therefore, schools must create a welcoming atmosphere where parents feel safe to share their ideas and concerns.

Teacher training plays a key role here. Teachers should develop communication skills and cultural competence to work effectively with families from different backgrounds. Hornby (2011) emphasizes that teacher education programs should include modules on parent engagement, conflict resolution, and collaborative problem-solving. When teachers are equipped with these skills, they can build trust and solve conflicts more constructively.

Technology can also support parent-teacher communication. During the COVID-19 pandemic, many schools used digital tools such as WhatsApp, Zoom, or school apps to stay in touch with parents (Garbe et al., 2020). These tools made it easier for busy parents to attend virtual meetings or receive updates about their child's progress. However, it is important to ensure that all families have access to these technologies and know how to use them.

In addition to individual efforts, school leadership must support partnership-building at a whole-school level. Policies should encourage family participation in decision-making bodies such as parent councils or school boards. Schools can organize workshops where parents learn about inclusive education and share their experiences. Such activities strengthen the sense of community and show that every voice matters (Benson and Padilla, 2023).

For instance, in Canada, inclusive schools often have "Parent Resource Centres" that provide information, training, and networking opportunities for parents (Yell et al., 2020). These centres help parents feel empowered and more involved in their child's education journey.

Moreover, parents themselves can support each other through parent networks or support groups. When parents share their stories and advice, they gain confidence and learn how to advocate for their children's rights. Schools can facilitate the creation of such groups by providing space and basic resources.

In conclusion, strong parent-teacher partnerships are a cornerstone of successful inclusive education. They are built on trust, respect, and shared responsibility. Teachers must recognize parents as valuable partners who bring unique knowledge about their children. At the same time, parents need to feel welcomed and heard. Through open communication, joint decision-making, and mutual support, schools can create inclusive environments where every child, regardless of ability, can learn and thrive. Future research and practice should continue to find effective ways to strengthen these partnerships, especially in diverse and low-resource contexts.
