Developing teacher design skills

Qulmanova Sabrina

5th year student at the University of Economics and Pedagogy

Аннотация: В данной статье рассматриваются некоторые принципы, которые лягут в основу развития навыков молодых и будущих педагогов.

Ключевые слова: Педагогика, воспитание, образование, способности.

Abstract: In this article, some rules that are the basis for the formation of the abilities of young and future pedagogues are covered.

Key words: pedagogy, upbringing, education, ability.

Pedagogy is the science of education. “Pedagogy” is a Greek word, and “paedagogos” means “child-leader”. As a result of the changing attitude of people to educational and spiritual perfection, the science of pedagogy (the art of guiding a child) has gained its place among the people. Thus, as a science that educates a person, pedagogy has taken a special place in the system of world sciences. The role of pedagogical scientists of the East and the West in the formation and enrichment of pedagogy as a science is great. The philosopher Farabiy, in his work “The Views of Virtuous City People,” commented on 12 virtues that are given to a person through education. Ibn Sina's "Tadbir al-manzil", Omar Khayyam's Rubaiyat, Yusuf Khos Hajib's "Kutadgu bilig", Kaykovus's "Qabusnama", Alisher Navoi's "Mahbub ul-qulub" ... turned the human heart into a treasure trove of various knowledge, and God hid Himself in this secret. The wonderful human body, like a secret treasure trove, keeps this secret secret, that is, the purpose of Allah in creating the entire universe is Man, who has no equal among all creatures.

Since the science of pedagogy focuses on two important aspects of personality development - his education and upbringing, didactics (theory of education) and the theory of upbringing are important components of the science. Didactics (educational theory, from Greek didaktikos "teacher", didasko "learner") studies the theoretical aspects of education, the essence of the educational process, laws and laws, principles, the activities of the teacher and the teacher, the purpose, content, form, methods, means, results of education, and ways to improve the educational process.

The object of pedagogical science is a holistic pedagogical process. The subject of pedagogical science is the educational process, content, laws, principles, form, methods and means. Tasks of pedagogical science. Pedagogical science contributes to ensuring the development of society based on the fulfillment of the social order of personality formation.

In determining the goals and objectives of pedagogical science, the content of social relations, the essence of the ideas that occupy a leading place in the life of a person are of great importance. The object of pedagogical science is a holistic pedagogical process. The subject of pedagogy is the educational process, its content, laws, principles, forms, methods and tools. The tasks of pedagogy.

The tasks of a teacher cover many aspects, but in general their main tasks are as follows:

1. Teaching: Teaching students knowledge and skills, conducting lessons effectively, explaining topics in an understandable way.

2. Reading and analyzing: Determining the level of reading of students and preparing lessons appropriate to them.

2024-6.875 ResearchBib IF: 9.948 / 2024

3. Individual approach to students: Taking into account the specific needs of each student, developing individual approaches to their development.
4. Assessment and monitoring: Assessing students' knowledge, using tests, exams, project work and analyzing their results.
5. Education: Educating students morally and socially, teaching them teamwork, respect and responsibility.
6. Pedagogical control: Monitoring the continuity, discipline and activity of students in the lesson.
7. Thinking and innovation: Developing creative thinking in students, testing and implementing new pedagogical methods.
8. Monitoring the social and psychological state of students: Analyzing the psychological and social state of students, providing psychological support if necessary.
9. Establishing connections between family and school: Cooperating with parents in the process of studying students, discussing their successes and problems.

A teacher, who is fully responsible for the education, development and upbringing of students, strives to perform his duties at a high level.

The goal of the teacher is to provide students with knowledge and skills, develop them intellectually and morally, as well as prepare them for social and cultural life. In other words, the goal of the teacher is;

1. To impart knowledge. To provide students with the necessary knowledge and create opportunities for them to learn based on scientific foundations.
2. To develop skills: To form critical thinking, creative approach, independent thinking and problem-solving skills in students.
3. To provide moral and cultural education: To introduce students to important principles such as moral values, social responsibility, respect, justice and cooperation and to encourage them to apply them in life.
4. To implement projects: To guide students to create new ideas, work in a team and implement various projects and activities.
5. Personal development: Taking into account the individual needs of students, helping them to fully realize their potential.

In general, the goal of a teacher is not only to impart knowledge, but also to help students achieve physical, mental, moral and social maturity.

In conclusion, it can be said that the pedagogical skills and communicative abilities of a teacher play an important role in education and upbringing. Today's youth should be comprehensively developed, able to express their correct attitude towards themselves, other people, society, nature and work, able to act independently, creative, enterprising and entrepreneurial. The development of these qualities in a student undoubtedly depends on the attitude and relationships that the teacher can establish with students in order to properly manage the educational process.
