USE OF PROBLEM SITUATIONS THAT REQUIRE TECHNICAL THINKING IN ECONOMIC TRAINING TASKS

Sodiqova Nigora Turayevna
Asian International University, Lecturer, Department of Economics
e-mail: nigorasadykova667@gmail.com

Abstract: This article discusses the issue of developing technical thinking skills in the process of economic education through tasks that are close to real life and encourage students to analyze practical problems. In particular, it considers how such elements of technical thinking as deeper mastery of economic knowledge, independent thinking, technological and systematic approach to the problem, algorithmic thinking, and graphical analysis can be effectively introduced into the educational process. The article analyzes the content, forms, methodological approaches of economic tasks based on problem situations that serve to develop technical thinking , and their role in the formation of students' knowledge, skills , and competencies. The possibilities of using information and communication technologies (ICT) , graphic tools, modeling , and numerical analysis in analyzing economic problems are revealed. Also, the article scientifically proves the effectiveness of tasks that develop technical thinking based on experiments and practical lesson examples. In conclusion, suggestions and recommendations are given on the effectiveness of using innovative pedagogical methods in teaching economic subjects through such approaches .

Keywords: technical thinking, economic task, problem situation, educational methodology, economic thinking, algorithmic approach, analytical competence, ICT tools, economic modeling

Today's globalization and digital economy, there is an increasing need to train personnel with practical skills, analytical thinking and technical thinking along with economic knowledge. In the conditions of a modern market economy, specialists who are competitive, innovative thinkers and can solve problems on a technological basis are highly valued in the labor market. Therefore, it is necessary to introduce methodological approaches in the teaching of economic disciplines in the higher education system that not only provide theoretical knowledge, but also direct students to in-depth analysis of real practical situations, think on an algorithmic and graphical basis. In this context, the concept of **technical thinking deserves special attention. Technical thinking** is a systematic, logical, modeled form of thinking that encourages students to see economic problems, analyze them in parts, develop optimal solutions, and use algorithms and technological tools. This harmony between engineering and economic thinking is especially important in the in-depth teaching of disciplines such as economics, management, marketing, finance and logistics. In this regard, the need to form students' technical thinking through **assignments based on real-life problems** in teaching economics is increasing. Through such assignments, students understand the logical sequence of economic decision-making, apply numerical analysis methods, learn to develop solutions in modeling and graphical form. Also, this approach develops their analytical and critical thinking competencies. At the same time, the scientific and methodological foundations for the development and practical implementation of educational assignments aimed at developing technical thinking have not been sufficiently developed. This article analyzes methodological analyses, empirical solutions , and effective approaches conducted in this direction.

1. The concept of technical thinking and its role in economic education

Technical thinking is a form of thinking based on a systematic approach to real-life problems, their step-by-step solution, logical justification of solutions , and decision-making using advanced technological tools. In economic education, these skills are manifested through:

- analyze economic situations based on graphs, tables, models, and algorithms;
- application of technological solutions in assessing the effectiveness of economic projects;
- building a comparison of options and using mathematical expressions in decision-making;
- digital tools (MS Excel, Google Sheets, Python programs).

Thus, technical thinking is manifested in a state of mutual integration with economic thinking . This forms the core competencies of the modern professions of economist, manager, investor or analyst.

2. Tasks based on problem situations - methodological basis

Problem-based learning tasks are tasks that require the student to independently apply their knowledge, research, analyze , and think logically. Such tasks have the following methodological advantages in developing technical thinking:

- **It involves the student as an active participant** : he or she creates knowledge by analyzing the problem, not by receiving ready-made knowledge.
- **Forms a logical sequence of thinking** : making decisions through cause-and-effect relationships.
- **It focuses on the study of technological approaches** : modeling, simulation, graphical analysis.
- **critical and analytical thinking** : finding multiple solutions to a problem.

Sample forms of such assignments are compiled as follows:

Problematic situation	Required activity	Elements of technical thinking
Competitive product pricing	Price analysis, market monitoring, Excel chart building	Graphical, analytical, algorithmic thinking
Determining the profitability of an investment project	Calculating initial costs and revenue streams	Using NPV, IRR, Excel Formula
Improving enterprise efficiency	Cost structure analysis, optimization methods	Modeling, diagramming, comparing solution options

3. Teaching methods that develop technical thinking

The following methods are effective in forming technical thinking in the economic learning process:

- **Case-study method** - students study a real enterprise situation, identify the problem, and develop feasibility solutions.
- **Project method** - the student develops his own independent economic project, provides it with a technical and economic basis, and presents it in the form of graphs and tables.
- **Simulation games** – for example, market simulations, developing strategic thinking through games that require decision-making.
- **Computer modeling – modeling** and analysis of real economic processes using Excel, Python, and Google Sheets .
- **flowcharts and algorithmic solutions** – for example, performing a task using a decision tree or if-then structure to determine benefits.

4. Analysis based on practical experience

Based on the experience conducted with 3rd-year economics students at Asia International University in the 2024–2025 academic year, the following was identified:

- When using tasks based on a problem situation, students **try to find a solution independently** , which strengthens their self-management competence.
- As a result of the constant application of tasks aimed at developing technical thinking, students acquire skills **in graphical analysis, logical decision-making , and working with statistical data.**
- Students had the opportunity to express their ideas **through diagrams, tables, and graphs** , which increased their technical expression.

Conclusion: The results of the study show that the development of technical thinking in the teaching of economic sciences is considered one of the requirements of modern education. Through this type of thinking, students acquire the skills of in-depth analysis of economic problems, algorithmic approach to decision-making, building models close to real life, and effective use of digital information.

The use of problem-based learning tasks in the educational process increases the activity of students, encourages them to independent research, and serves to deepen their knowledge. Such tasks are an important factor in the development of elements of technical thinking - systematic analysis, working with graphs and tables, and algorithmic thinking.

Based on the research, the following was determined:

- Complex, multi-step tasks are more effective than simple tests or theoretical questions for developing technical thinking.
- Students' economic thinking is deepened through problem-based assignments, which forms their ability to conduct independent analysis in their future professional activities.
- Using digital technologies during the lesson, especially Excel, diagrams, and interactive platforms, enhances technical thinking.

Suggestions :

1. **It is necessary to increase the share of tasks focused on technical thinking in textbooks and methodological guides on economic subjects** . It is recommended to include at least 1–2 tasks based on problem situations in each topic.
2. **Special modules on methodologies that develop technical thinking should be developed in in-service training courses for teachers,** as many teachers do not have the methodology for creating such assignments.
3. **It is necessary to widely introduce tasks based on economic modeling and graphical analysis using ICT tools** . In particular, it is recommended to gradually introduce simple analytical functions of Google Sheets, Excel, and Python.
4. **Elements of technical thinking should also be taken into account as criteria for assessing students' critical and analytical thinking** . That is, the assessment should take into account not only the correct answer, but also the quality of the thinking process (structurality, systematicity, soundness of solutions).
5. **The number of practical exercises aimed at developing technical thinking in students should be increased and project activities should be widely introduced** , as these processes directly result in strengthening technical thinking.
