Multifunctionality and polysemy of lexical units of verbs in Russian and Uzbek languages.

Malika Khayitovna Kurbanova
Lecturer, Termez State University of Engineering and Agricultural Technologies

Abstract:
Multifunctionality and polysemy are also characteristic of lexical units of verbs in the Russian and Uzbek languages, the study of which is relevant in the context of modern trends: typological study of languages with different structures. The peculiarity of the verb system in the Russian and Uzbek languages also lies in the fact that significant differences are observed in relation to the functional and grammatical plan of vocabulary units of this lexical and grammatical subsystem of verbs.
Key words: verb system, lexical unit, verb subsystem, multifunctionality and polysemy.

Comparative study of two languages is carried out on the basis of identifying current problems, the most priority of which, in our opinion, is the verb and its research is a multi-aspect system. For the study of the Russian verb, a huge contribution was made to the history of development and formation in the history of theoretical issues of this part of speech by fundamental works of V.V. Bogdanov, L.V. Shcherba, A.V. Bondarenko, V.V. Vinogradov, D.N. Shmelev and many others. In the Russian and Uzbek languages, in general, the derivational potential and word-formation capabilities of verbs are one of the most active groups. Verbs have equivalents not only in Slavic, but also in the Baltic and Indo-European languages. For many centuries in the Russian language, despite its archaic nature, they are actively used. Verbs have a high frequency, for example, according to the dictionary of "Lexical minimums of the modern Russian language" of 1985, some of these verbs are among the 500 most commonly used words in the Russian language. Verbs have traditionally been the subject of methodological and linguistic research. Information about them can be found not only in studies specifically devoted to this group, but also in publications of academic grammar of the Russian language, in textbooks for students majoring in philology, and in Russian language manuals for foreign students. However, they generally reflect the use of verbs in colloquial speech in their direct meaning and in some secondary meanings. Our modest contribution to the study of this group of verbs is that it is the first to pose and attempt to resolve the issues of verb functioning in the differently structured Russian and Uzbek languages. The group of verbs is related not only semantically, but also morphologically. Comparative studies show that they are imprinted differently in different languages, and universal situations receive different divisions. In this study, the extralinguistic bases of verbs, which function as their materialized nature, are subjected to comparative analysis. Comparative study of the lexical layer shows that the specificity of the Russian and Uzbek languages can manifest itself not only in the lexical semantics itself, but also in the word-formative, reflecting, at the same time, the grammatical features of a specific language system, which is confirmed by the comparative-typological study of the verbs of the Russian and Uzbek languages. When determining the aspects of studying vocabulary, comparative-contrastive linguistics comes to the forefront, allowing us to establish elements of similarity and divergence in the field of related and unrelated languages in a synchronic plan. Like any socio-cultural phenomenon, the need for mutual awareness of nations within the framework of linguistic culture, interethnic linguistic contacts, arising primarily from a new dimension of the linguacultural integration process and the common desire of nations to build their relationships on a qualitatively new spiritual and cultural basis, pose problems of comparative

study of languages and their lexical sublevels to modern linguistics. Understanding and understanding the essence of a particular verbally designed linguistic sign determines the analysis of the technique of its nominations in the diachronic or synchronic plane of language. In connection with This is why modern linguistics is characterized by a tendency to research using data from various languages, to develop complex problems that are borderline in languages with different structures. The range of issues under study includes consideration of the internal organization of language, its functioning in the text, its correlation with extralinguistic reality, the pragmatic orientation of linguistic units and their elements in the process of interaction and creation of various communication plans. The current state of scientific development of topical problems of linguistics, the task of semasiology and lexicology, and their relationship with grammar, prospects for the general development of the theory of meaning and nuance cause a search for linguistic innovations, a new look at previous problems and involve many issues that have not been studied in a comparative plan in the orbit of scientific research in linguistics. Among them, a special place is occupied by the linguistic nature and lexical and grammatical realities of the verb of the Russian and Uzbek languages. The introduction of the verb of the Russian and Uzbek languages into the space of a particularly relevant research microfield, the explication of language factors that specifically indicate the semantic parameters of verbs, suggests the application of a variety of linguistic analysis methods to them, since, as Academician V.V. Vinogradov notes, "The verb is the most complex and most capacious grammatical category." Therefore, today, in connection with the solution of theoretical and applied problems of modern linguistics, among the especially important issues of comparative linguistics, the problem of stratification of semantic classes of verbs in languages \u200b\u200bof different structures is becoming increasingly relevant. All semantic varieties of the verb, including verbs, cause great difficulties in the process of mastering the system of the Russian language by non-Russians. In this regard, the study of verbs in a comparative sense is relevant, primarily because the different typological affiliation of languages, the specifics of their lexical structure determine the specifics of the functioning of lexical and grammatical means of conveying the methods and nature of movement. In this regard, the synchronous and comparative analysis conducted allows us to conclude that the issues under consideration are relevant in the practice of translating fiction. The range of scientific research in this area has been expanding and deepening more and more intensively over the past decade. This has led to the fact that, firstly, along with comparative grammars, a large number of detailed studies have appeared in which certain particular phenomena in the structure of different languages are considered in a contrastive manner. Secondly, comparative studies have increasingly become based on one of the foreign languages. This is due to both the intensive expansion of international relations and the increasing need for high-quality teaching of foreign languages in the context of bilingualism. A significant number of studies being conducted create, in turn, favorable conditions for the appearance of general works in the field of contrastive linguistics, which, of course, contribute to raising the general scientific and theoretical level of newly undertaken research. Understanding the semantic features of the language being studied is necessary for successful teaching and mastering this language, for qualified translation from one language to another. The identification of semantic differences between languages is possible only through comparative study, the principles and methods of which have not yet fully developed and require scientific development. The development of a theory explaining the semantic features of national languages, enriching the practice of comparative descriptions of different languages, for example, Russian, which belongs to the inflectional system, and Uzbek, which is a representative of the agglutinative system, is an urgent

task of modern linguistics. This is precisely what determines the relevance of the topic of this study. Units of various subsystems of language have semantic specificity to varying degrees. Some linguistic units have been studied from this point of view, while others have not yet been sufficiently studied. Scientists have repeatedly described the discrepancy between the meanings of lexical units in the compared languages, which is due to the complexity of the semantic structure of the word. The verb is one of the most important lexical and grammatical categories of the general system of parts of speech. The study of this lexical and grammatical category has a long history. The verb is "the most complex, grammatically organized, abstract and at the same time the most saturated category" (V.V. Vinogradov) of the grammatical structure of each language, in which lexical polysemy is combined with the richness and diversity of grammatical forms, which is also observed in the verb system. Polysemy and multifunctionality of lexical units largely determine the national specificity of the lexical system of the language and create significant difficulties in mastering foreign languages. Multifunctionality and polysemy are also characteristic of lexical units of verbs in the Russian and Uzbek languages, the study of which is relevant in the context of modern trends: typological study of languages with different structures. The originality of the verb system of the Russian and Uzbek languages also lies in the fact that significant differences are observed in relation to the functional and grammatical plan of vocabulary units of this lexical and grammatical subsystem of verbs. All of the above to a certain extent determines the importance and relevance of the topic. Consideration in a comparative aspect of the semantic organization of verbs in Russian and Uzbek languages, microsystems of verbs with the semantics of movement in Russian and their correspondence in Russian. The verb as an independent lexical and grammatical category and its individual lexical units are the most complex and multifaceted in comparison with other lexical and grammatical categories and individual lexical units. All this is characteristic of each dictionary meaning of verbs in the languages we compare.
