IMPROVING THE EFFICIENCY OF USING ELECTRONIC DATABASES IN THE RESTORATION, DESIGN, AND PRESERVATION OF HISTORICAL MONUMENTS

Khorezm Mamun Academy, PhD Student (Basic Doctoral Program), Sherzod Shamuratovich Duschanov, duschanovsherzod719@gmail.com tel. +998907267100

Annotation:

This article explores the application of modern digital technologies in the documentation, modeling, and preservation of architectural monuments located in the Ichan-Kala complex of Khiva. It details the process of collecting comprehensive information, including historical data, photographs, and videos, followed by the development of precise three-dimensional (3D) models using professional software such as AutoCAD and 3ds Max.

The study also discusses the integration of these materials into a specially created website, forming an electronic database that facilitates the restoration, reconstruction, and conservation of heritage sites. By employing such technologies, the restoration process becomes significantly more efficient—allowing for accurate visualization, quicker decision-making, and time-saving benefits.

Furthermore, the article emphasizes the broader implications of this digital approach, including its potential to support tourism, education, and cultural heritage awareness. The use of virtual reality (VR) technologies enhances public access and engagement, while simultaneously providing experts with valuable tools for long-term preservation planning. Ultimately, the research highlights the importance of adopting innovative, technology-based strategies in the conservation of Uzbekistan's rich architectural legacy.

Keywords: Uzbekistan, architectural monument, cultural heritage, database, 3D model, digital preservation, website, Khiva, heritage sites, archive, architectural design, virtual reconstruction, 3D visualization, computer software, spherical view, interactive technology, visualization device, video, 360-degree view, museum, VR 360 device, immersive experience, restoration, digital modeling, historical architecture, computer-aided design (CAD)

Main Project: In the historical Ichan-Kala complex of Khiva, which covers an area of 26 hectares, I developed accurate and scaled 3D models of all architectural monuments using AutoCAD and 3ds Max software (Figure 1). Comprehensive data including information, photographs, and video footage of these monuments were collected [1] (Figure 2). Based on this data, an electronic database of Khiva's architectural monuments was created in the form of a website [2].

This initiative was particularly important because, at present, archival design documentation for many of Khiva's architectural monuments is either incomplete or entirely unavailable. Therefore, the creation of a unified digital platform helps to preserve, manage, and facilitate access to detailed information about these historic structures.

Figure 2. General View of the Website

During the design processes, both quality and, importantly, speed are significantly improved. Time is saved, and more effective architectural decision-making is achieved, leading to highly efficient outcomes. Computer technologies make it possible to "preserve what remains and simultaneously restore what has been lost" [3].

These technologies enable successful implementation of virtual restoration and reconstruction by combining intuitive and creative thinking with scientific methodologies and advanced technologies [4].

In today's context, the use of computer software in design processes has become essential. It allows for the acceleration of restoration and reconstruction work, enables the exploration of multiple visual options, and facilitates the selection of the most optimal and high-quality design solutions.

To achieve realistic representations of architectural projects, it is essential to use modern modeling software. These tools are required for accurately determining colors, visualizing volumes and dimensions, and creating 3D renderings, video clips, animations, and scaled models.

The above-mentioned digital projects can serve not only the fields of architecture, construction, restoration, and archaeology, but also provide a valuable database for areas such as education, tourism, commerce, and advertising. A snapshot of the database interface is presented in Figure 3.

The website created for this purpose can be accessed at: [http://78.24.216.17/sites/ancient/pages/recons/index.php]

Figure 3. Layout View of the Website Information

By uploading three-dimensional models and animations developed through computer software to online platforms, it becomes possible to share detailed information about historical monuments with a global audience. Utilizing virtual reality (VR) headsets, users can immerse themselves in the 3D reconstructions and experience the architectural spaces as if they were physically present inside them.

This approach not only enhances public awareness of Uzbekistan's rich cultural heritage, but also plays a vital role in attracting a greater number of tourists. By strengthening the flow of international visitors, the initiative contributes to the global promotion of Uzbekistan's historical monuments, traditions, and customs.

From an economic perspective, it also increases the potential for generating additional foreign income for the country through the tourism sector.

Figure 4. VR-BOX Device

With the help of modern VR equipment, it is now possible to develop and explore virtual representations of both interior and exterior architectural designs. For example, a virtual 3D visualization of the Ibrohim Khoja House Museum was created using 3ds Max software. This model allows for an immersive experience of the space (see Figure 4).

However, the full immersive effect can only be appreciated when viewed through a VR-BOX headset, which enables users to perceive the space as though they are physically present within the room. Such spherical images, when uploaded to the internet, can be made available to a global audience.

At the end of these videos or visual presentations, an engaging message such as:
"If you wish to truly feel the atmosphere of the era—sense the freshness of the air, hear the footsteps on ancient floors, and immerse yourself in the lifestyle of the time—then a visit to Khiva is a must" can greatly enhance the emotional impact and serve as a powerful tool to attract more tourists.

Figures 5 and 6 show the 360-degree visualizations created for the Ibrohim Khoja House Museum, while Figure 7 presents the floor plan of the museum.

Conclusion. The use of modern technologies in the restoration of architectural monuments represents a revolutionary approach in the preservation of cultural heritage. Projects developed through advanced computer technologies not only facilitate the accurate and efficient restoration of historical structures, but also help to predict and prevent future deterioration.

Digital tools such as 3D modeling, virtual reality (VR), and database management systems offer unprecedented opportunities to document, visualize, and analyze monuments in great detail. These technologies ensure the integrity and longevity of cultural assets by enabling experts to make data-driven decisions and simulate various restoration scenarios before implementation.

Moreover, such innovations make cultural heritage more accessible to a wider audience—locally and globally. They support the creation of educational and interactive platforms that engage students, researchers, tourists, and heritage professionals alike.

Ultimately, this forward-thinking approach serves not only as a preservation tool, but also as an effective medium for transmitting cultural and historical values to future generations. Embracing technology in heritage conservation ensures that the stories, identity, and legacy embedded in architectural monuments continue to inspire and educate for years to come.
