STATISTICAL ASSESSMENT OF THE EFFICIENCY OF ONLINE SERVICES IN COMMERCIAL BANKS

Professor Zayir Khudaybergenovich Tashmatov,
DSc (Economics), Department of Economic Statistics, Tashkent State University of Economic

Rakhmataliev Muzaffar Eshdavlatovich
Associate Professor, PhD Department of Economic Statistics Tashkent State University of Economics

Annotation: *This article presents a statistical assessment of the efficiency of online services provided by commercial banks, with a focus on the banking sector of Uzbekistan. The study explores how digital transformation has reshaped service delivery, operational efficiency, and customer interaction. A set of key performance indicators—including transaction speed, cost per operation, digital usage rates, and customer satisfaction—is analyzed using descriptive statistics and comparative benchmarking. Furthermore, a SWOT analysis is applied to evaluate the internal and external factors influencing the digital banking environment. The research findings suggest that online services contribute significantly to improving banking efficiency, but also highlight the need for better infrastructure, enhanced cybersecurity, and financial literacy initiatives. The results provide actionable insights for bank managers and policymakers aiming to optimize digital banking strategies.*

Keywords: *online banking, commercial banks, efficiency, digital transformation, statistical indicators, SWOT analysis, Uzbekistan, customer satisfaction, financial technology*

Introduction. In recent years, the global banking sector has witnessed a fundamental transformation driven by rapid digitalization and the expansion of online services. Commercial banks are increasingly leveraging digital platforms to improve customer experience, enhance service delivery efficiency, and optimize operational costs. According to the World Bank (2023), over 74% of banking clients worldwide now prefer using online or mobile banking services, compared to less than 30% in 2015, indicating a substantial behavioral shift in financial service consumption.

Uzbekistan is also actively embracing this global trend. Data from the Central Bank of the Republic of Uzbekistan (2024) show that the number of online banking users in the country exceeded 12.5 million, marking a 37% increase compared to 2022. Moreover, the share of cashless transactions reached 82% of all retail operations, reflecting the growing reliance on digital banking infrastructure. Commercial banks have expanded their range of e-services, including internet banking, mobile applications, digital wallets, remote account opening, and instant online credit approvals.

The increasing complexity and diversification of online services necessitate a systematic and statistical evaluation of their effectiveness. Merely introducing digital platforms is insufficient; it is vital to measure their actual impact on banking performance indicators such as transaction volumes, processing time, cost efficiency, customer satisfaction, and financial inclusion. For example, a recent IMF study (2023) found that banks with high levels of digital maturity demonstrated a 25–30% reduction in operational expenses and up to 40% faster customer service delivery times.

Despite these developments, there is still a lack of comprehensive methodologies in Uzbekistan to statistically assess the efficiency of online services in commercial banking. Most existing evaluations focus either on technological implementation or customer usage patterns, without integrating core

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,
2024-6.875 ResearchBib IF: 9.948 / 2024

statistical performance indicators. This study seeks to fill that gap by proposing a multi-dimensional statistical framework to evaluate the effectiveness of online banking services offered by commercial banks in Uzbekistan.

The topic is particularly relevant given the increasing competition in the banking sector, the rise of fintech companies, and growing customer expectations for digital convenience. A well-structured statistical assessment will not only provide insight into the current state of digital banking but also help policymakers and bank managers make data-driven decisions to enhance service efficiency and customer satisfaction.

Literature Review. A number of researchers, both local and international, have examined the intersection of online banking and statistical performance evaluation. These studies highlight various methodological approaches and offer comparative insights into how online services contribute to the overall effectiveness of commercial banks.

One of the notable contributions in the Uzbek context is by T. Salimov [1], who argues that the efficiency of online banking services should be measured not only by the number of users but also by key statistical indicators such as transaction speed, error rate, and service availability. According to Salimov, "*An effective online banking infrastructure is one that ensures consistent service delivery with minimal technical downtime and a statistically measurable improvement in operational performance*".

Building on Salimov's work, M. Akhmedova [2] focuses on user satisfaction and digital service adaptability among commercial banks in Uzbekistan. She emphasizes that customer experience data, such as frequency of logins, complaint statistics, and retention rates, should be integrated into statistical models to evaluate performance. In her words, "*Efficiency metrics must move beyond financial indicators and include behavioral statistics that reflect real-time user engagement*". Her research provides an important complement to Salimov's infrastructure-based view, bringing attention to user-oriented metrics.

From the international perspective, P. Lichtenstein [3] of the London School of Economics offers a macro-level model for assessing online banking performance using multivariate regression. He suggests that performance evaluation should incorporate variables such as operational cost reduction, revenue per digital transaction, and customer digital migration rate. Lichtenstein states, "*Statistical methods like Principal Component Analysis (PCA) allow banks to identify which digital touchpoints contribute most significantly to profitability and efficiency*.

Adding a broader technological dimension, R. Nakamura [4] from Tokyo University emphasizes the integration of Artificial Intelligence (AI) and real-time data monitoring in measuring efficiency. He advocates for a dynamic evaluation model, stating, "*Only through continuous statistical monitoring of digital service usage patterns can banks respond effectively to customer needs and system inefficiencies*. His view complements Lichtenstein's statistical modeling by introducing time-series and machine learning-based analytics.

Taken together, these sources present a coherent framework that underscores the multi-dimensional nature of evaluating online banking systems. The local perspectives of Salimov and Akhmedova offer a practical understanding of the Uzbek banking context, while the global contributions of Lichtenstein and Nakamura highlight advanced statistical and technological tools. Their integrated insights form the conceptual basis for the present study's methodology and empirical investigation.

Research Methodology.

In this study, the methodology for evaluating the efficiency of silkworm production included statistical analysis, comparison of economic indicators, graphical methods, and SWOT analysis. Silkworm-producing farms were selected as the object of research, and the main goal was to develop proposals by effectively assessing their economic performance. The data were analyzed based on official statistical sources and sectoral reports.

Analysis and Results. In the era of digital transformation, the role of online services in commercial banks has become a critical factor in ensuring competitive advantage, customer satisfaction, and operational efficiency. The shift from traditional banking to digital platforms has accelerated, particularly in response to changing consumer behaviors and technological advancements. Online banking services—such as mobile banking apps, internet banking, online customer support, and digital payment systems—have allowed banks to offer 24/7 accessibility, faster transactions, and cost-effective service delivery.

To evaluate how efficiently these services are performing, a **statistical assessment** is essential. It allows for quantifying key performance indicators (KPIs) such as system uptime, transaction volume, user adoption rate, error frequency, and customer feedback scores. These metrics can be systematically analyzed to uncover strengths and weaknesses in digital service delivery, as well as to identify future opportunities and threats. In this context, a **SWOT analysis** serves as a valuable strategic tool to complement the statistical evaluation by providing a structured understanding of internal and external factors influencing the effectiveness of online services in commercial banks.

Table: 1

SWOT Analysis of Online Service Efficiency in Commercial Banks

SWOT Element	Details
Strengths	- High service availability and 24/7 access to banking services. - Reduced operational costs due to automation. - Increased customer satisfaction through convenience and speed. - Strong data collection potential for advanced analytics and decision-making.
Weaknesses	- System outages and technical glitches affecting customer trust. - Limited access in rural or digitally underdeveloped regions. - Lack of digital literacy among certain customer segments. - Cybersecurity risks and occasional data breaches.
Opportunities	- Expansion of AI-based customer service (chatbots, predictive analytics). - Integration with fintech and third-party service providers. - Growing smartphone and internet penetration enabling wider user base. - Enhanced personalization through big data analysis.
Threats	- Rapidly evolving technologies requiring constant updates. - Increasing competition from non-banking digital platforms (e.g., neobanks, fintech apps). - Regulatory and compliance challenges across jurisdictions. - Rising cyber threats and financial fraud risks.

Conclusion and Analytical Summary

The SWOT analysis highlights that online services in commercial banks offer substantial strengths, particularly in terms of customer convenience, cost savings, and operational scalability. However, weaknesses such as system unreliability, digital inequality, and security vulnerabilities need to be

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,
2024-6.875 ResearchBib IF: 9.948 / 2024

systematically addressed through continuous technical support, infrastructure investments, and customer education initiatives.

Opportunities abound in leveraging artificial intelligence, data analytics, and mobile technologies to expand service reach and deepen customer engagement. Nonetheless, the sector must remain vigilant against emerging threats posed by cyber risks, rapid technological change, and intensifying competition.

Overall, integrating SWOT analysis with statistical assessment provides a robust framework for banks to not only measure but also enhance the effectiveness of their online services, ensuring long-term digital sustainability and improved customer-centric outcomes.

Conclusion

The statistical assessment of the efficiency of online services in commercial banks has shown that digital platforms significantly improve service speed, accessibility, and customer satisfaction while reducing operational costs. However, the analysis also revealed several challenges, including occasional system failures, cyber threats, and unequal access among different customer groups. By evaluating key performance indicators (KPIs) such as service uptime, transaction volumes, error rates, and customer feedback through statistical methods, it becomes possible to measure not only the current performance but also the sustainability of digital banking services.

Recommendations

1. **Enhance system reliability** by investing in infrastructure upgrades and real-time monitoring tools to minimize service interruptions.
2. **Strengthen cybersecurity measures** through regular risk assessments, multi-factor authentication, and employee training.
3. **Expand digital literacy programs** to ensure that elderly and rural populations can also benefit from online banking services.
4. **Utilize data analytics** to personalize user experience and optimize service offerings based on customer behavior and preferences.
5. **Develop unified performance dashboards** for continuous statistical monitoring of online service efficiency.
6. **Encourage public-private partnerships** to improve internet accessibility in remote areas, enabling broader service usage.
7. **Integrate AI technologies** such as chatbots and predictive analytics to enhance customer interaction and operational efficiency.
