Annotation: *This research explores the key factors and future prospects for improving the efficiency of the agricultural lending system through commercial banks. It highlights the growing importance of innovative credit products and digital financial technologies in increasing access to finance for agricultural enterprises, especially smallholder farmers. By analyzing both local and international studies, as well as statistical indicators from commercial banks in Uzbekistan, the study provides a comprehensive assessment of current challenges and development opportunities. The research concludes that integrating fintech solutions, improving risk management mechanisms, and fostering public-private partnerships can significantly enhance the effectiveness of agricultural finance and contribute to sustainable rural development.*

Keywords: *Agricultural finance, commercial banks, innovative credit products, financial inclusion, digital technology, risk management, rural development, fintech.*

Introduction. Agriculture remains a foundational sector for many economies worldwide, especially in developing countries such as Uzbekistan, where it contributes approximately 17% to the country's Gross Domestic Product (GDP) and employs nearly 28% of the labor force (World Bank, 2023). The sector is critical not only for ensuring national food security but also for sustaining rural livelihoods, reducing poverty, and promoting inclusive economic growth. Small and medium-sized agricultural enterprises, particularly family-owned farms and cooperatives, form the backbone of this sector. However, their potential for growth and modernization is often constrained by limited access to adequate and affordable financial resources.

Commercial banks play a pivotal role in mobilizing financial capital and providing credit to the agricultural sector. The agricultural lending system through commercial banks is designed to facilitate farmers' access to funds necessary for purchasing inputs such as seeds, fertilizers, machinery, and irrigation systems, as well as for investing in innovative farming practices. According to data from the Central Bank of Uzbekistan (2023), loans extended to the agricultural sector account for nearly 25% of total bank lending in the country, underscoring the sector's priority in national financial strategies. Despite this significant share, the efficiency of the agricultural lending system remains a pressing concern due to several structural and operational challenges.

Key factors limiting the efficiency of agricultural credit through commercial banks include high perceived credit risks stemming from the sector's vulnerability to weather fluctuations and price volatility, inadequate collateral from smallholder farmers, and insufficiently tailored financial products that fail to meet the unique needs of agricultural enterprises. Additionally, many commercial banks lack specialized agricultural finance expertise, which limits their capacity to assess and manage agricultural credit risks effectively. The lack of robust agricultural credit guarantee schemes further exacerbates these issues, leading to cautious lending practices that restrict credit availability and inflate borrowing costs for farmers.

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-5, ISSUE-6

Improving the efficiency of agricultural lending is vital for accelerating the sector's development and fostering sustainable economic progress. Enhanced credit access can empower farmers to adopt modern technologies, increase productivity, and expand their production capacity, which, in turn, can contribute to increased rural incomes and improved food security. The United Nations Food and Agriculture Organization (FAO, 2022) emphasizes that countries with well-functioning agricultural finance systems typically experience higher rates of agricultural growth and poverty reduction.

This study seeks to analyze the multifaceted factors affecting the efficiency of agricultural lending by commercial banks in Uzbekistan and to explore viable prospects for improvement. By examining both internal factors—such as lending policies, risk assessment techniques, and product innovation—and external factors including regulatory frameworks and government support programs, this paper aims to identify actionable strategies for overcoming existing barriers. The integration of digital financial technologies, credit guarantee schemes, and capacity-building initiatives for banking staff will also be discussed as critical components for enhancing lending efficiency.

In conclusion, the efficient functioning of the agricultural lending system through commercial banks is not merely a financial concern but a strategic imperative for Uzbekistan's socio-economic development. Strengthening this system aligns with the country's broader goals of modernizing agriculture, ensuring food security, and promoting sustainable rural development. This research contributes to the ongoing discourse by providing an evidence-based assessment of current challenges and proposing pathways to optimize the role of commercial banks in supporting the agricultural sector's growth.

Literature Review. The issue of enhancing the efficiency of the agricultural lending system has recently attracted significant attention not only in Uzbekistan but also globally. Local researchers, particularly Mirzaev and Tokhtayev [1] , analyzed the existing challenges faced by commercial banks in providing loans to the agricultural sector and proposed innovative approaches to improve lending mechanisms. Their study identified the main obstacles for farmers in accessing credit as insufficient collateral and high interest rates.

Moreover, Kholbotayev [2] emphasized the need to diversify credit products of commercial banks for small business entities in agriculture and examined the potential to increase financing efficiency through the implementation of digital financial technologies. Qodirov [3] assessed the economic efficiency of loans allocated to agriculture and suggested ways to strengthen cooperation between banks and farmers.

According to local scholars, modernizing the lending system and improving financial literacy are crucial for achieving sustainable development in agriculture.

Among foreign researchers, Jensen and Barrett [4] analyzed the importance of innovative financial products, particularly digital lending and microfinance tools, in enhancing financing efficiency in agriculture. Their study highlighted that designing tailored credit mechanisms for smallholder farmers and delivering them through digital platforms simplifies the credit access process and improves efficiency.

Nguyen et al. [5] investigated the role of digital financial technologies in evaluating the efficiency of agricultural lending systems and demonstrated that these technologies help expand access to financial services in rural areas and optimize financing systems.

Furthermore, Smith and Anderson [6] explored risk management methods employed by commercial banks in agricultural lending and proposed innovative approaches to improve the quality of loan

2024-6.875 ResearchBib IF: 9.948 / 2024

portfolios. Brown and Taylor [7] analyzed the digitalization of agricultural credit systems and the implementation of technologies to simplify the loan process and enhance efficiency.

Overall, both local and international studies emphasize that introducing innovative technologies and financial products within bank operations, alongside increasing financial literacy among farmers, are essential for the effective development of agricultural lending systems.

Research Methodology. This study employs a mixed-methods approach combining both qualitative and quantitative research techniques to analyze the factors affecting the efficiency of agricultural lending through commercial banks. Quantitative data were collected from bank reports, agricultural loan portfolios, and farmer surveys to assess loan performance, interest rates, and repayment patterns. Qualitative insights were gathered through interviews with bank officials, agricultural experts, and farmers to identify challenges and opportunities in lending processes. Statistical tools such as regression analysis and SWOT analysis were used to evaluate key determinants and prospects for improving the lending system's effectiveness.

Analysis and Results. Agricultural lending through commercial banks is a vital component for stimulating growth and sustainability in the agricultural sector. Despite its importance, the efficiency of this lending system faces numerous challenges, including limited access to credit for small-scale farmers, high interest rates, and inadequate collateral. These obstacles hinder the sector's full potential and impact food security and rural development. Recent advancements in financial technologies and innovative credit mechanisms offer promising solutions to improve lending processes. This study aims to analyze the key factors influencing the efficiency of agricultural lending systems and explore prospects for enhancing their effectiveness to support sustainable agricultural development.

Table. 1

SWOT Analysis of Enhancing the Efficiency of the Agricultural Lending System through Commercial Banks

SWOT Analysis	Internal Factors	External Factors
Strengths	- Wide network and infrastructure of commercial banks- Experienced financial specialists- Capability to implement digital technologies	- Government incentives and subsidies for agriculture- Stable economic growth and increased focus on agriculture
Weaknesses	- Limited assets and collateral of small farmers- Restricted range of agricultural credit products in banks- Low level of financial literacy	- Inadequate infrastructure in rural areas- Complex and bureaucratic procedures in the loan application process
Opportunities	- Development of digital financial technologies and fintech solutions- Opportunities to diversify and customize credit products- Strengthening cooperation between farmers and banks	- Expansion of global financing sources- Government programs and international organizations supporting agricultural investments
Threats	- Economic instability and inflationary pressures- Problems with loan repayments and deterioration of credit portfolio quality-	- Natural disasters and climate change leading to reduced agricultural productivity- Changes

SWOT Analysis	Internal Factors	External Factors
	Increased competition and changes in financial services	in legislation and regulatory challenges

The issue of enhancing the efficiency of the agricultural lending system is shaped by numerous internal and external factors within the operations of commercial banks. The results of the SWOT analysis help identify the main strengths and weaknesses, as well as opportunities and threats in this process.

Among the strengths are the extensive network and developed infrastructure of commercial banks, along with the presence of qualified financial specialists, which create a solid foundation for improving system efficiency. Furthermore, the ability to implement digital technologies plays a crucial role in accelerating and simplifying the credit provision process. External factors such as government incentives and subsidies for agriculture, as well as stable economic growth and focused attention on the sector, serve as important support mechanisms for the lending system.

Weaknesses include, in particular, the limited collateral and assets held by small farmers and the low level of financial literacy, which exacerbate the challenges commercial banks face in granting loans. The limited range of agricultural credit products available in banks hinders the full realization of lending opportunities. In the external environment, inadequate infrastructure in rural areas and complex bureaucratic procedures complicate the loan acquisition process, thereby reducing the system's efficiency.

Among the opportunities are the rapid development of digital financial technologies and fintech solutions, the potential to diversify credit products and tailor them to the specific needs of farmers. Additionally, developing new mechanisms to strengthen cooperation between farmers and banks represents a significant prospect. From an external perspective, the expansion of global financing sources and the support provided by government and international organizations to attract investments in agriculture hold great potential for system development.

Threats include economic instability, inflationary pressures, and difficulties in loan repayment, which are primary factors reducing system efficiency. Moreover, natural disasters and climate change negatively impact agricultural productivity, thereby affecting the quality of the loan portfolio. Changes in legislation and regulatory challenges may also threaten system stability. Furthermore, changes in the financial services sector and increased competition compel banks to adopt more innovative solutions.

Based on the SWOT analysis, commercial banks should focus on the following strategic measures to enhance the efficiency of the agricultural lending system:

- Broad implementation of digital technologies to expedite lending processes and reduce bureaucratic barriers;
- Development of specialized educational programs and advisory services to improve the financial literacy of small farmers;
- Diversification of credit products and customization to meet the individual needs of various agricultural segments;
- Expansion of the use of government and international financing sources to increase funding volumes;

2024-6.875 ResearchBib IF: 9.948 / 2024

- Improvement of risk management systems and introduction of innovative approaches to enhance the quality of the loan portfolio.

These measures will enable the agricultural lending system to become more efficient, sustainable, and competitive, while positively contributing to the development of small business entities in agriculture.

Conclusion. Improving the efficiency of the agricultural lending system is a crucial factor for economic stability and the development of the agricultural sector. The results of the SWOT analysis indicate that the extensive infrastructure and skilled personnel of commercial banks serve as a solid foundation for the system's development. Additionally, the implementation of digital technologies creates significant opportunities to enhance the efficiency of lending processes. However, low financial literacy among small farmers, insufficient collateral, and bureaucratic obstacles in rural areas remain key factors limiting system efficiency. Among external factors, government incentives for agriculture and the expansion of international financing sources positively influence the system's development. At the same time, economic instability, climate change, and legislative changes pose threats to the system's stability. Therefore, addressing internal weaknesses and effectively leveraging external opportunities are essential for enhancing the efficiency of agricultural lending.

Recommendations

- **Expand the implementation of digital financial services:** Automate lending processes and develop electronic platforms to reduce bureaucratic barriers and simplify access to credit.
- **Enhance financial literacy:** Organize specialized training and advisory services for small farmers to improve their financial knowledge and expand their access to credit.
- **Diversify credit products:** Develop and introduce flexible credit products tailored to the diverse needs of farmers.
- **Effectively utilize state and international financing sources:** Increase the mobilization of government programs, grants, loans, and subsidies provided by international organizations for agriculture.
- **Improve risk management and monitoring systems:** Introduce innovative mechanisms to identify and manage new risks, improve the quality of credit portfolios, and ensure loan repayment.

These measures will enable commercial banks to develop the agricultural lending system in a more efficient, sustainable, and innovative manner, significantly contributing to the growth of the agricultural sector.
