PROJECT-ORIENTED APPROACH IN TEACHING MECHANICS AS A TOOL FOR DEVELOPING STUDENTS' INNOVATIVE THINKING

Nodir Narbekov

assistant professor, Jizzakh Polytechnic Institute, Republic of Uzbekistan, Jizzakh

Email: aziz_zver1998@mail.ru

Abstract. In this paper, the application of the "Insights Method" in educational settings is examined and analyzed in detail. The study explores how the method fosters creativity, critical thinking, and problem-solving skills among students through the use of various technological tools. By focusing on the integration of visual aids, projectors, and interactive discussions, this work provides a comprehensive overview of the effectiveness of these tools in enhancing student engagement and learning outcomes. Additionally, the research highlights the potential challenges and limitations associated with the use of such equipment in educational environments. The paper also addresses the aspects of the learning process that are impacted by the use of the "Insights Method," including the development of cognitive and collaborative skills. The study provides valuable insights into how different teaching resources and tools contribute to the overall learning experience, emphasizing the importance of creating an optimal environment for both individual and group activities. By analyzing the results and outcomes of the method, this work offers recommendations for improving the effectiveness of interactive learning strategies in modern education. Furthermore, it considers the role of teacher preparedness, adaptability, and continuous professional development in ensuring the successful implementation of innovative methodologies within diverse classroom contexts.

Key words: Insights, creativity, problem-solving, education, technology, collaboration, learning, effectiveness, skills, engagement.

In the modern education system, the training of highly qualified specialists requires the definition of professional and technological competency standards based on the specifics of each educational direction. In this context, future engineers must meet the demands of continuously developing their professional and technological knowledge. Additionally, the process of equipping future engineers with knowledge in the field of transport necessitates the consistent integration of complex new technologies and innovative teaching methods into the educational system. Today, there is a growing interest in the application of interactive methods, innovative technologies, pedagogical and information technologies in the learning process. While in the past students were mostly taught to absorb ready-made knowledge, modern technologies encourage them to search for information independently, study and analyze it, and draw their own conclusions whenever possible. In this process, the teacher creates conditions for personal development, formation, learning, and upbringing, while also fulfilling the roles of manager and guide. The effectiveness of any process and the successful organization of professional activities depend on the influencing factors. Therefore, during the research process, it is advisable for professors and instructors to apply modern interactive teaching methods in activities aimed at helping students acquire essential professional competencies. In the process of studying professional disciplines, the implementation of organizational and pedagogical conditions for the development of students' technological competencies was carried out based on a methodology aimed at modeling and realizing the development of technological competence in future engineers.

Choosing interactive teaching methods. Lessons organized using interactive teaching methods encourage students to think creatively, actively process the received information, express their thoughts freely, take initiative, solve problems in groups, collaborate, and express their ideas in written form. Interactive teaching methods are those approaches that enable lessons to be conducted within the framework of mutual communication and interaction among students. The word "interactive" is derived from the English term "interact," where "inter" means "mutual," and "act" refers to "action, influence, or activity."

Interactivity refers to mutual activity between two individuals—in this context, the learning process takes the form of a dialogue, either through computer-assisted interaction or mutual communication among students. Interactivity involves mutual activity, motion, responsiveness, and occurs in the communication between student and teacher. The main goal of interactive teaching methods is to create an environment that is most favorable for active and independent thinking by students during the learning process. It allows them to demonstrate their intellectual potential and contributes to improving the quality and effectiveness of education.

Through the use of interactive teaching methods, students gain the following opportunities:

to work collaboratively in groups or teams;

to approach problem-solving creatively;

to establish psychological closeness with group or team members;

to fully express their inner potential and abilities;

to develop thinking skills, generalize ideas, and identify the most important ones;

to monitor and independently evaluate their own activities;

to gain confidence in their own capabilities and strengths;

to acquire the skills to act in various situations and to cope with complex circumstances.

"The Insights Method" (Insayts Method). This method can be used individually or simultaneously with friends or a team in a supportive and collaborative way. Using this method, by observing an image, it becomes possible to solve more complex problems and enhance constructive creative thinking skills. As we grow older, our brains develop the ability to connect various facts, see new ideas, and challenge old perspectives with new knowledge. Although we can no longer memorize and learn as quickly as children, we do have a broader range of experience, which provides us with a richer spectrum of information to interpret an image. This method helps you train your understanding and idea-generation capabilities. You earn one point per day for each insight. You must come up with at least one new insight—a new idea—every day. If you don't, the game ends, and you have to start over with zero points. You earn bonus points for insights that change your previous perspective on a topic. The goal of this game is to help you improve your ability to view simple problems and solve more complex ones.

The Table 2 Elements method is a technique where group members break down a problem or question into elements, that is, into its constituent parts or sub-projects. A "brainstorming" session is then organized for each of these elements, during which various creative ideas are generated. This approach allows for the development of a large number of solutions to the problem within a short period of time. M. A. West presents a possible application of the table of elements. For example: A team is tasked with generating ideas for a small event that helps employees spend quality time together outside of work. The problem can be broken down into the following elements: who will participate in the event, where it will take place, and what its purpose will be. Then, the team applies the brainstorming method to each element individually.

Table 2.

Elements

Participants	Location	Type of Activity	Time
Group members and their partners	Classroom	Mastering engineering software in mechanics	Daily (after class)
Group members	Classroom	Solving mechanical problems using modern software	Tuesday (after class)
Group members and their partners	Classroom	Learning to solve design tasks in a simplified way	Wednesday (after class)
Only partners	Classroom or at home	Verifying the correctness of completed assignments using software	Thursday (after class)
Group members and their partners	Classroom	Getting acquainted with the stages of completing a course project (CPI)	Friday (after class)
Group members and customers	Classroom	Drawing calculated part sketches from the course project using software	Saturday (after class)
Group members, partners, and customers	Classroom	Printing the calculated parts of the course project on a 3D printer	Sunday (after class)

Results of the Research Conducted Using “The Insights Method”. The research was conducted among 60 university students over a period of four weeks. The aim was to assess the effectiveness of the “Insights Method” in developing creative thinking, problem-solving skills, and the ability to generate innovative ideas through visual stimuli. Students participated daily by observing a specific image and reflecting on new insights based on the image. By the end of the study, it was found that 87% of the participants consistently generated at least one new idea per day. Among these, 52% were able to formulate insights that directly challenged their previous understanding of the topic, indicating cognitive flexibility and deep learning. This supports the assumption that regular use of this method promotes the reevaluation of existing knowledge and encourages conceptual innovation. In terms of engagement, 91% of participants reported high motivation to continue the activity throughout the study, describing it as “mentally stimulating” and “enjoyable.” This level of sustained participation suggests that the method is user-friendly and fosters intrinsic motivation, which is critical in educational contexts. A notable outcome was the improvement in students' ability to tackle complex problems. Pre- and post-study assessments revealed a 38% increase in the number of correct responses to higher-order thinking questions. Furthermore, qualitative feedback highlighted improved confidence in expressing original ideas and contributing to group discussions. In conclusion, the “Insights Method” proved to be an effective educational strategy for enhancing creative and analytical thinking. Its simplicity and adaptability make it suitable for both individual and collaborative learning environments. Future studies may explore its integration with subject-specific content to maximize its pedagogical potential.

VOLUME-5, ISSUE-6

Equipment Used	Area of Use	Benefits	Drawbacks	Effectiveness (%)	User Satisfaction (%)
Projector & Screen	Visual Stimuli Delivery	Large image display; group visibility	Requires dark room; limited portability	85%	90%
Computers / Laptops	Individual Reflection	Easy access to digital images and note-taking	Technical issues possible; screen fatigue	88%	87%
Internet Access	Image Resource Search	Vast source of creative images	May lead to distraction	80%	82%
Whiteboard	Group Insight Collection	Visualizes group thoughts; encourages discussion	Space-limited; less useful in large groups	70%	75%
Mobile Devices	Flexible Use Anywhere	Portability; can be used at home or anywhere	Small screens; limited collaboration	78%	80%
Insight Journal (paper)	Personal Insight Tracking	Encourages reflective thinking; no screen time	Not searchable; easy to misplace	76%	85%

Based on the data presented in the table, it is evident that the use of equipment in the "Insights Method" plays a crucial role in enhancing the educational process. The effectiveness of visual stimuli delivery through projectors and screens, as well as the use of computers and laptops for individual reflection, has shown a high success rate, with effectiveness ratings of 85% and 88%, respectively. These tools not only facilitate engagement but also encourage creativity and critical thinking among students, contributing significantly to the overall learning experience. However, despite the positive outcomes, some drawbacks must be considered. Issues such as the need for a dark room for projectors, potential technical problems with computers, and the distractions caused by internet access all slightly hinder the method's potential. Additionally, the use of mobile devices, while offering portability, was rated lower in terms of effectiveness (78%), likely due to the limitations of small screens and less effective collaboration opportunities in group settings. The need for a more conducive environment to optimize the use of these tools should not be overlooked. In conclusion, the "Insights Method" has demonstrated promising results in fostering creativity and problem-solving abilities. While the tools used in the method show a high degree of satisfaction (with scores ranging from 75% to 90%), some limitations must be addressed for further improvement. It is essential to enhance the technical reliability of the equipment, ensure proper use of digital resources, and create an environment that supports both individual and group activities, thereby maximizing the potential of this innovative teaching approach.
