Student of the "Primary Education" Department

Abstract:
This article analyzes the potential of using context-based texts in developing reading culture among primary school students. In particular, the new generation mother tongue textbooks, especially the Grade 2 textbook published by Novda Edutainment, include texts that are closely related to real-life situations. These texts stimulate students' interest in reading and foster the development of skills such as text analysis, logical thinking, and comprehension.

Keywords: primary education, mother tongue textbook, reading culture, contextual text, literacy, educational competencies, text analysis

In today's education system, approaches aimed at forming and developing literacy competencies have gained increasing importance. In particular, fostering a reading culture among primary school students encompasses not only the level of technical reading but also the development of skills such as comprehension, understanding, logical thinking, and the ability to perceive intertextual connections. Modern educational processes are oriented toward forming students' knowledge by integrating personal experience, cognitive levels, and environmental awareness. In primary education, literacy is not limited to mechanical reading skills but includes the ability to comprehend a text, perform logical analysis, identify the main idea, and independently express personal viewpoints. Therefore, the significance of context-based texts in shaping students' reading culture is steadily increasing. **The contextual approach** is a methodological principle aimed at linking learning materials with students' everyday life experiences, transforming the learner from a passive listener into an active participant in the thinking process. This approach is especially evident in new-generation textbooks, including the Novda Edutainment mother tongue textbooks for grades 2 and 3, which promote contextual reading through texts, tasks, and question-and-answer activities based on real events and social situations. As a result, students develop a more active, critical, and thoughtful attitude toward texts. **A context-based text** is one that is created in connection with students' real-life surroundings, daily experiences, and social events. Such texts serve to enhance their thinking, understanding, and analytical skills.

Therefore, lessons built around context-based texts not only improve technical reading skills but also foster students' abilities to deeply analyze texts, comprehend events and ideas, and relate them to their personal experiences. This, in turn, contributes to the development of students' reading culture. The contextual texts included in the new generation of textbooks also increase student engagement, promote independent thinking, and develop discussion and communication skills. For example, the text titled "Mars Rover" from the Grade 2 mother tongue textbook reads as follows:

In 1996, scientists launched self-operating robots to the planet Mars. Such a device is called a "Mars rover." To date, five Mars rovers have reached the neighboring planet. These robots move across Mars and study the composition of its soil. They take pictures of the planet and send them to scientists on Earth. The scientists carefully analyze the images and study other data sent by the rovers.

In this way, knowledge about the planet Mars continues to grow. In the near future, similar robots will be sent to other planets as well. [1]

This type of text, which presents scientific facts in an accessible and engaging way, encourages students to analyze information, ask questions, and connect the material to broader real-world knowledge, thereby fostering the habits of an informed and thoughtful reader.

This short yet content-rich text introduces children to the concepts of the planet Mars, rockets, and Mars rovers. The textbook author engages students in active reflection through several context-based tasks:

- **Asking questions based on content.** Open-ended questions placed after the text—such as "Could there be life on Mars?" or "If you were an astronaut, what gift would you take to Mars?"—broaden students' imagination and compel them to analyze the core meaning of the text.
- **Expanding vocabulary.** Tasks such as identifying scientific terms like "Mars rover," "spacecraft," and "rocket," and writing their meanings in a vocabulary notebook, help build students' terminological literacy.
- **Expressing personal opinion.** Writing or speaking exercises like "How interesting do you find traveling to Mars?" or "Which sentence excited you the most?" support the development of students' reflective thinking skills.
- **Socio-emotional analysis.** Discussing the emotions of the text's characters—such as excitement, fear, or joy—helps children acquire empathy and moral reasoning skills.

As a result, context-based texts such as "Mars Rover" foster the development of reading culture not only at the initial stage of education but also lay the groundwork for effective thinking and learning processes at subsequent educational levels. By activating reading engagement, applying text interaction techniques, and enhancing content comprehension, literacy competencies are thoroughly developed. Consequently, the student perceives the text not merely as something to be read, but as a source for critical thinking. These texts reflect real-life situations and are harmonized with the student's social and psychological state. As a result, the learner connects the events of the text with personal experience, reflects, answers questions, and expresses personal opinions. This leads to the development of skills such as understanding, reconstructing, and logically analyzing texts [2]. Moreover, the tasks included in the textbook are also based on the contextual approach. For instance,

ISSN: 2582-4686 SJIF 2021-3.261, 2022-2.889, 2023-5.384, 2024-6.875 ResearchBib IF: 9.948 / 2024

among the questions following the text are open-ended prompts like “Does this situation seem familiar to you?” and “Have you ever experienced something similar?” These encourage students to relate the content to their own lives, thus fostering communicative and reflective competencies.

In my conclusion, context-based texts play an invaluable role in developing reading culture among primary school pupils. Such texts move students beyond passive learning and engage them in understanding reality, expressing personal opinions, and conducting critical analysis. Particularly, the Grade 2 Mother Tongue textbook authored by Saydullo Kuronov includes texts like “Mars Rover”, which offer extensive opportunities to develop content-focused reading skills, personal reflection, vocabulary knowledge, and communicative competencies. The findings of this study suggest that lessons organized around contextually selected texts not only improve students’ text comprehension but also foster a positive attitude toward reading, and develop their abilities for independent thinking and reasoning. Therefore, increasing the quantity of life-based, purposeful, and engaging texts in mother tongue textbooks is one of the key directions in enhancing literacy competencies in primary education.
