Methods for Expanding the Assortment of Dried Stone Fruit Products

Master of Tashkent State Agrarian University
N.A.Mirzaakhmedova

Abstract. This article analyzes methods for expanding the assortment of dried stone fruit products, specifically apricot, plum and cherry. The focus is on developing new product types, improving drying technologies, implementing packaging innovations, adapting to market demands, and ensuring environmental sustainability. The practical possibilities and export prospects of expanding the assortment in the context of Uzbekistan's agriculture are examined. The study is based on scientific literature, Uzbekistan's normative-legal documents, and market analysis. The article provides recommendations for innovative approaches, quality standards, and market strategies to diversify the assortment, contributing to Uzbekistan's competitiveness in the global market.

Keywords: Stone fruits, apricot, plum, cherry, drying technologies, assortment expansion, innovations, packaging, food industry, export, environmental sustainability, market demands, Uzbekistan.

Introduction. Dried stone fruits—apricot, plum, and cherry—hold a significant place in agriculture and the food industry. These fruits are valued for their high nutritional properties (vitamins A, C, E, antioxidants, dietary fiber, and minerals) and long shelf life, making them highly sought after in both local and international markets. In Uzbekistan, drying stone fruits is a key agricultural sector, with over 50,000 tons of dried apricots and plums and 5,000 tons of dried cherries exported in 2023 (Uzbekistan Statistics Agency, 2024). Expanding the assortment of these products can enhance competitiveness, capture new markets, and meet consumer demands. Dried fruit production and export in Uzbekistan are regulated by legal frameworks. The Law of the Republic of Uzbekistan "On Food Safety" (2021) mandates compliance with microbiological and chemical safety standards and sanitary norms. The Law "On the Development of Agriculture" (2004) supports the adoption of modern technologies in processing and export preparation of agricultural products. The DSt 3302:2015 standard, approved by the "UzDavStandart" agency, sets requirements for dried fruits' moisture content (10–15%), organoleptic properties, and storage conditions. These normative-legal documents ensure product quality and alignment with market demands.

This article examines methods for expanding the assortment of dried stone fruit products, including developing new product types, improving drying technologies, and implementing packaging and market strategies. The study aims to analyze practical and innovative methods for assortment expansion in Uzbekistan's agriculture, enhancing product quality, and increasing export potential. Based on scientific literature, market analysis, and Uzbekistan's experiences, the advantages, limitations, and prospects of these methods are evaluated.

Main Body

1. Importance and Opportunities of Assortment Expansion. Expanding the assortment of dried stone fruit products is crucial for meeting consumer demands, increasing market competitiveness, and adding value to agricultural products. Apricots, plums, and cherries, with their high nutritional properties (vitamin C, antioxidants, dietary fiber), serve as a foundation for producing diverse products. For example, dried apricots and plums are in high demand in traditional markets, while dried cherries have gained popularity in premium markets (Europe, USA) in recent years (Global Trade Data, 2024).

Assortment expansion can be achieved through several approaches:

• New product types: Packaged snacks, muesli bars, nutritional supplements, and additives for bakery products.

• Technological innovations: Modern drying methods (infrared, lyophilization) to produce high-quality and diverse products.

• Packaging and branding: Eco-friendly, convenient, and modern packaging to enhance market appeal.

• Market strategies: Capturing new market segments, such as organic products.

Development of New Product Types Producing diverse products from dried stone fruits is a key direction for assortment expansion.

2.1 Snacks and Muesli Bars. Dried apricots, plums, and cherries are increasingly used in snacks and muesli bars, which are gaining popularity due to healthy eating trends and convenient consumption formats. Adding nuts and grains to muesli bars made from dried cherries and apricots enhances their nutritional value (Smith et al., 2020). In Uzbekistan, enterprises like "EcoFruit" produce snacks based on dried apricots and plums, exporting to China and Russia (UzAgroTech, 2023).

2.2 Nutritional Supplements and Bakery Additives. Dried fruits processed into flour (e.g., apricot flour) or granules create new opportunities for bakery products, confectionery, and nutritional supplements. For instance, desserts made from dried cherry flour are rich in antioxidants and in demand in premium markets.

2.3 Organic and Functional Products. Demand for organic dried fruits is growing, particularly in Europe and the USA. Organic certification (e.g., EU Organic) can increase the export price of dried apricots, plums, and cherries by 20–30%. Functional products, such as vitamin-enriched dried fruits, appeal to health-conscious consumers.

3. Improving Drying Technologies. Drying technologies play a critical role in assortment expansion, impacting product quality and diversity.

3.1 Optimization of Natural Drying. Natural drying (sun drying) is cost-effective and environmentally friendly but challenging for quality standardization. Uzbekistan's dry climate (3000 hours of sunshine annually) is ideal for drying apricots and plums, but cherries' delicate structure requires additional protection (e.g., mesh structures). Studies show that natural drying results in a 20–30% loss of vitamin C (Smith et al., 2020). Sulfur dioxide is commonly used to improve quality, but its use is limited for organic products.

3.2 Mechanical Drying. Mechanical drying at 50–70°C ensures consistent quality and is suitable for apricots, plums, and cherries. In Uzbekistan, enterprises like "AgroExport" dry over 10,000 tons of products annually using mechanical methods (Uzbekistan Statistics Agency, 2024). Hybrid equipment (solar-powered) can reduce costs by 30–40% (UzAgroTech, 2023).

3.3 Modern Technologies

• Infrared Drying: Dries in 4–6 hours, retaining 85–90% of vitamin C and antioxidants, ideal for apricots and cherries (Zhang et al., 2022).

• Microwave Drying: Dries in 1–2 hours but may reduce antioxidants in cherries (Aliyev, 2023).

• Lyophilization (Freeze-Drying): Retains 95% of nutritional properties, suitable for premium products but less common in Uzbekistan due to high costs (Global Trade Data, 2024).

4. Packaging and Branding Innovations. Packaging plays a vital role in assortment expansion. Eco-friendly packaging (biodegradable materials) and convenient formats (individual packs, vacuum-sealed) attract consumers. For example, 50–100-gram packaged snacks made from dried apricots and cherries are in high demand in Europe (Global Trade Data, 2024). Branding with a "Made in Uzbekistan" label and organic certification can increase product value by 20% (Aliyev, 2023).

5. Market Strategies and Export Opportunities. Adapting to market demands is critical for assortment expansion.

• Organic Market: Demand for organic dried fruits in Europe and the USA has grown by 15% (Global Trade Data, 2024). Expanding organic certification in Uzbekistan can boost exports.

• Premium Segment: Lyophilized cherries and apricots are in high demand in premium markets.

• New Markets: Growing demand in China, Japan, and South Korea offers opportunities for expansion.

Recommendations include improving farmers' skills, subsidizing modern equipment, and developing marketing strategies.

Conclusion

Expanding the assortment of dried stone fruit products is vital for advancing Uzbekistan's agriculture and export potential. Developing new product types (snacks, muesli bars), adopting modern drying technologies (infrared, lyophilization), implementing eco-friendly packaging, and aligning with market strategies (organic certification, premium segments) enhance product diversity. Uzbekistan can improve product quality and competitiveness through hybrid equipment, solar energy, and farmer training. Future research should focus on innovative technologies, cost optimization, and capturing new markets.
