THE IDEOLOGICAL FOUNDATIONS AND PSYCHO-MORAL MECHANISMS OF CYBERBULLYING

Saidikromkhoja Usmonov
Independent Researcher, National University of Uzbekistan PhD in Philosophy, Associate Professor
G-mail:usmonovsadikromxodja@gmail.com

Abstract: This article explores the ideological and psycho-moral foundations of cyberbullying in the context of the digital age. It analyzes how the rapid development of information and communication technologies has transformed not only the exchange of information, but also the social, psychological, and moral-ethical landscape of society. The paper examines the spread of cyberbullying through ideological manipulation, information warfare, loss of national identity, and the weakening of collective responsibility, focusing on both psychological and moral mechanisms. It discusses the role of national ideology, traditions, and spiritual values in protecting youth and society from cyber threats, as well as the importance of developing information culture, media literacy, and preventive measures at the state and community levels. International and national experiences are compared, and practical recommendations are provided for strengthening moral immunity and digital resilience among youth.

Keywords: cyberbullying, ideological foundations, psycho-moral mechanisms, youth, information warfare, moral immunity, national values, media literacy, digital society, collective responsibility.

Studying cyberbullying from ideological-moral and psycho-sociological perspectives has become one of the most urgent topics in contemporary philosophy, psychology, pedagogy, information security, and sociology. In the 21st century, the rapid development of information and communication technologies has drastically changed not only the way information is exchanged, but also the socio-psychological and moral-ethical fabric of society. Under such conditions, ideological and moral threats in cyberspace, conscious and unconscious psychological changes among youth, the weakening of collective identification and responsibility, have paved the way for the widespread phenomenon of cyberbullying.

The Ideological Basis of Cyberbullying: Theoretical Foundations and Scientific Concepts

The ideological and moral interaction in cyberspace — Ideology, especially national ideology and universal values, serves as a spiritual and moral pillar in the development of both individuals and society. Thinkers of the East such as Farabi, Ibn Sina, and Yusuf Khos Khodjib emphasized the role of social consciousness and morality in collective stability. Their teachings state that when a society's moral immunity and ethical philosophy are left unprotected, extremist, negative ideologies, and forms of social violence become widespread.

In contemporary times, the weakening of the ideological environment, information attacks, "fake" and false information, virtual manipulation, stereotypes, the crisis of identity among youth, anonymity in online networks, and processes of collective passivity are shaping the psychological and ideological roots of cyberbullying.

Information Warfare and the Effect of Ideological Vacuum

In cyberspace, "information warfare" directed against collective consciousness and national values, the spread of false or prohibited information, the activities of radical groups and manipulators, are

expanding the ideological basis of cyberbullying. As D. Ismoilova notes, information warfare is not only a political but also a moral and ethical threat. Especially for young people, school and university students, and individuals spending significant time online, ideological vacuum, indifference to national history and traditions, and a crisis of global identification are intensifying.

The Impact of the Virtual Environment and National Ideology

In Uzbekistan and other post-Soviet countries, national ideology and traditions, spiritual and moral stability serve as crucial factors in protecting society from threats in cyberspace. However, recent studies show that, on the internet, the spread of memes, virtual blackmail, nationalism, religious extremism, and cyberbullying aimed at undermining national values, identity, and traditions are leading to the weakening of national consciousness among youth.

Psycho-Moral Mechanisms of Cyberbullying

First of all, it is necessary to consider the psychological roots and personal characteristics when discussing the psycho-moral mechanisms of cyberbullying. One factor shaping these mechanisms is a person's psychological state, upbringing, and the influence of the collective environment. From a psychological point of view, anonymity on the internet, reduced empathy, group influence, and lack of personal responsibility increase the likelihood of committing cyberbullying. For example, research by Livingstone and Smith indicates that young people often act not as individuals, but as "online personas," which eliminates moral restraints and leads to the normalization of violent behavior.

Erosion of Moral Standards

In cyberspace, moral boundaries, values, and collective ethics are rapidly changing. The loss of moral "boundaries," the belief among youth that "anything is possible," the tendency to avoid clear personal opinion in virtual environments, and the notion that threatening or insulting others is a "legitimate response," are becoming increasingly common. Under the influence of anonymous groups, "online lynching," "virtual isolation," and the "smart cabin effect" are observed.

Psychological and Collective Consequences

As noted in the studies of A. Mo'minov and M. Egamberdiyev, cyberbullying leads to psychological and collective fragmentation in society, increased mistrust, social fragmentation, alienation from national and moral traditions, a sense of "nakedness" in the virtual world, and decreased social activity. Among youth, tendencies such as "spreading false information for personal gain," "hiding one's identity," "inability to cope with victimhood," and "inclination towards collective opposition" are intensifying.

Anonymity and Decreased Empathy

Based on the psychology of anonymity, in the virtual environment a person may perceive themselves not as a "member of society," but as a random, irresponsible participant. In this psychological state, empathy — the ability to emotionally respond to others' pain — decreases. As psychologists note, reduced empathy in the online environment leads to cyberbullying, insults, threats, and psychological blackmail.

Collective Mechanisms: "Online Group Pressure" and "Virtual Lynch"

Another psycho-moral mechanism is group pressure and the influence of online communities. Due to the "group effect" in the virtual environment, individuals often sacrifice their personal views for the interests or stereotypes of the group. This leads to the emergence of "online lynching" or "virtual court" environments, which result in social stress, psychological depression, and moral weakness.

National Features and Prevention Mechanisms

In Uzbekistan, national ideology, moral values, and collective environment play an important role in forming an individual's moral immunity in cyberspace. As noted by D. Ismoilova, R. Qurbanov, A. Mo'minov and other scholars, instilling concepts such as "information culture," "moral immunity," and "civic responsibility" in youth, training parents and school specialists, and developing cybersecurity and prevention centers are fundamental protection mechanisms.

National Legislation and Practical Solutions

Uzbekistan has implemented the Law "On Cybersecurity," as well as state and public projects such as "Cybersecure Family," "Internet Moral Culture," and "Issues of Information Security and Ideological Stability." Preventive trainings and educational activities are carried out in families and educational institutions. Developing information and cyber culture has become a key task for the state and society.

A View of Developed Countries

In Japan, Korea, the USA, and the European Union, programs such as "online safety culture," "digital citizenship," and "media literacy" are implemented to develop the information and moral immunity of youth. In the EU, there are centers for psychological and legal assistance to cyberbullying victims; in the US, there is a "National Strategy Against Cyberbullying"; and in Korea and Japan, online prevention and counseling platforms have been introduced.

Conclusion

The ideological and psycho-moral foundations of cyberbullying are a complex socio-philosophical and psychological phenomenon closely related to spiritual stability, information culture, and modern mechanisms of individual and collective relationships. In order to protect against moral and ideological threats in cyberspace, it is necessary to develop education and information culture, strengthen psychological services and prevention centers, and establish national and international cooperation.

Analysis of the ideological and psycho-moral mechanisms of cyberbullying shows that this complex socio-philosophical and psychological phenomenon poses a serious threat to all strata of modern society, and its elimination requires comprehensive measures. Today, strengthening the moral immunity of individuals and society in cyberspace, deeply instilling national and universal values in youth, and increasing information culture and digital literacy remain among the most urgent tasks.

National and international practice shows that, in order to effectively combat moral and ideological threats in cyberspace, it is necessary to coordinate the efforts of the state, public organizations, educational institutions, and families, to continuously develop preventive and educational activities, and to train youth in active citizenship and moral responsibility.

While Uzbekistan is developing a system of legislation and prevention against cyberbullying, further developing information culture in education, expanding special training and counseling platforms for youth and parents, strengthening collective monitoring and psychological support services are of great importance for the future. In addition, continuous scientific research in the field of international cooperation, innovative technologies, and the development of online ethics is required.

At the same time, preventing cyberbullying and reducing its ideological and moral impact requires ensuring the integration of information technologies, national spiritual traditions, and the intellectual potential of society, as well as fostering digital literacy and a sense of responsibility in every citizen — one of the main conditions of modern progress.

VOLUME-5, ISSUE-7

In conclusion, the in-depth study of the ideological and psycho-moral foundations of cyberbullying and the development of effective elimination mechanisms are among the main guarantees of the spiritual stability of society, the consciousness of youth, and national development.
