IMPROVING THE METHODOLOGY FOR DEVELOPING ORAL LITERACY IN PRIMARY SCHOOL STUDENTS

Utegenova Dilnoza Aygali kizi
Doctoral student at the NSPI after named Ajinyaz

Annotation: This article explores innovative approaches to improving the methodology for developing oral literacy in primary school students. Oral literacy, being a foundational skill, plays a crucial role in the formation of communicative competence, critical thinking, and overall academic success. The research emphasizes interactive and student-centered teaching methods, including storytelling, role-playing, dialogic teaching, and the use of multimedia resources to enhance students' speech fluency, vocabulary acquisition, and listening comprehension. Furthermore, the article highlights the importance of integrating culturally relevant materials to foster engagement and develop students' expressive abilities in meaningful contexts.

Key words: Oral literacy, primary school education, interactive teaching methods, storytelling, listening comprehension, verbal communication skills.

INTRODUCTION

In the modern educational landscape, the development of oral literacy among primary school students has emerged as a fundamental component of effective communication and academic success. Oral literacy, which encompasses a child's ability to listen, comprehend, and express ideas verbally with clarity and coherence, forms the foundation upon which reading, writing, and critical thinking skills are built. Despite its significance, traditional pedagogical methods often prioritize reading and writing, inadvertently neglecting systematic approaches to enhancing students' oral competencies.

The early years of schooling represent a critical period for cultivating oral literacy, as children are at the peak of language acquisition and cognitive flexibility. However, current methodologies frequently lack interactive, student-centered strategies that promote active participation, meaningful dialogue, and context-based communication. Consequently, students may struggle with articulating their thoughts, engaging in discussions, or developing confidence in public speaking contexts.

Improving the methodology for developing oral literacy requires a comprehensive reevaluation of instructional practices, integrating innovative techniques such as dialogic teaching, collaborative learning, storytelling, and digital media tools. Furthermore, fostering a classroom environment that encourages active listening, reciprocal communication, and expressive language use is essential for nurturing students' oral proficiency (5).

Pupils use language structures as a basis for learning how to read. Therefore, elementary school students learning must incorporate the child's personal use of oral language. Thay apply oral language to grasp the basic foundations of reading. This will support them as they attempt new concepts and become better readers. They then must recognize the patterns in textual language to get bet- ter at reading itself. As textual patterns become more sophis- ticated, children will begin to notice that these patterns differ from the textual patterns they encounter in text. They learn that there are differences in the way they talk and the way that books "talk". They begin to understand that textual language can be different from spoken language.

Material and methods

The skills development that takes place elsewhere in the curriculum, such as learning about and through language, is complemented by primary language instruction. It promotes general literacy abilities and makes it easier to review and solidify first language topics and abilities.

The program is enhanced by language acquisition. For both teachers and pupils, it offers challenge, excitement, and fun, which fosters eager learners and lifelong favorable attitudes toward language acquisition. The teaching and learning process can be improved by the organic connections that exist between languages and other subject areas. The acquired abilities, information, and comprehension significantly impact children's literacy and oracy development as well as their comprehension of both their own and other cultures (1).

Methods for teaching;

1. Use an engaging approach to developing reading which integrates both decoding and comprehension skills
2. Teach students to use strategies for developing and monitoring reading comprehension

The vast majority of children have achieved an exceptional level of proficiency by the time they are five years old, despite the complexity of the knowledge needed for verbal communication. Some of their linguistic achievements include the ability to speak intelligibly more than 90% of the time, to have a vocabulary of up to 10,000 words, to construct compound and complex sentences, to express negatives, to use a variety of tense forms, to take turns in conversations, to contribute pertinent ideas and information, and to share anecdotes. (2).

Important facets of language development were explained, including vocabulary growth, sentence construction, and language usage. It was emphasized how vocabulary, grammar, and pragmatics are interdependent in early language development. Vocabulary was evaluated in terms of both the development of individual word understanding and the capacity to classify words, a process that takes place as the child considers language in addition to utilizing it.

In order to support a ‘modes of meaning’ approach to language development, a model incorporating the forms and structure of language was presented that includes listener-speaker-communicator skills and language uses (pragmatics), and language content and structure (semantics and syntax).The model, which specifies key subcomponents in each of these areas, could serve as a framework for both curriculum development and assessment (3).

Number of oral language development activities that could be used to promote reading comprehension including:

- establishing a purpose for reading
- activating relevant background knowledge
- posing open-ended questions that require deep processing
- responding to pupils initiatives
- promoting peer interaction.

Vygotskian approach that is based on the premise that participation in argument and discussion promotes critical thinking skills, particularly an understanding of the argument schemes that are critical in reading and writing (3).

Bottom-up models - early models of the reading process, or information processing models of reading such as those put forward by Gough (1972), and La Berge and Samuels (1974) represented a detailed letter-by-letter or ‘bottom up’ approach to understanding reading. Gough’s theory of the reading process described the flow of information during reading as a sequentially-ordered set of

transformations from letter, to phoneme, to lexical level representation and finally to deep structural representation (6).

Results and discussion:

The complex system of language is dependent on a wide range of developmental processes, including general cognitive functions like short-term memory, cognitive skills relevant to language, perceptual and auditory processes, and speech production motor abilities. Early intervention and assessment of children's response to language intervention are essential to preventing persistent language delays that may affect reading.

Many of the recommendations for enhancing reading through the development of oral language discourse are also applicable to writing. For example, we can conceptualise writing as comprising lower- order (constrained) skills such as spelling, on the one hand, and higher-order (unconstrained) skills such as knowledge of text genres and sensitivity to author and audience on the other.As with word- reading, oral language contributes to the development of the phonological processes underpinning spelling. Indeed, spelling often appears alongside oral reading as a measure of early literacy skill. But, for most children, spelling improves quite rapidly in the early years of schooling. On the other hand, children's understanding of text genres (e.g., narrative, argumentation) takes time to evolve, and can be supported by the types of discussion or discourse that occur around texts that pupils have read.

The core of education and pedagogy is dialogue. Oral language development is very important in early education for social ties, friendships, and interactions as well as for creating a feeling of community. Both directly through language engagement and indirectly through the creation of an environment full of learning stimuli, educators support children's oral language development. The purpose of this chapter is to demonstrate how teachers handle oral language in preschool settings and how using particular strategies yields better outcomes than using others. The important role that oral language plays in a young child's literacy development, it is of the utmost importance that adults who work with young children support the growth of the child's spoken language beginning in infancy.
