MODERNIZATION OF SOLAR AND WIND RENEWABLE ENERGY STATIONS IN UZBEKISTAN

Narimanov Bahodir Absalamovich

Senior Lecturer of the Department of Power EngineeringJizzakh Polytechnic Institute

Introduction: Energy Landscape and Renewable Role

Uzbekistan's energy sector is overwhelmingly fossil-fuel based. In 2019, natural gas accounted for over 90% of primary energy production. Electricity generation has similarly relied on thermal power (gas/coal) and hydropower; renewables beyond hydro were negligible until recently. Total domestic energy supply in 2019 was about 47.1 Mto, with oil and coal contributing the remainder and hydropower about 1%. In practice, renewables (solar, wind, hydro, bio) provided roughly 10% of electricity in 2019 and early 2020.

Against this backdrop, the government has set **ambitious decarbonization goals**. Uzbekistan's Paris Agreement commitments and climate strategies include cutting CO_2/GDP by 10–35% by 2030, and pursuing carbon neutrality by 2050. In support, renewables are to play a large role: official targets range from 20–25% renewable electricity by 2025–2030. The 2019–2030 Green Economy Strategy explicitly calls for raising renewables to "more than 25% by 2030" (from ~10% in 2019). The 2020 Concept Note sets medium-term goals of 5 GW solar and 3 GW wind by 2030 (initially zero large-scale solar in 2019). Current plans even aim for **8 GW** of solar+wind by 2026. Recent policy statements have floated an overall clean energy capacity of **20–25 GW by 2030**, covering roughly 40% of demand. These targets are driven by rising electricity demand (projected >7%/year growth) and the need for energy security, as well as international climate commitments.

Government Policies and National Strategies

The government has enacted a comprehensive suite of laws and strategies since 2017. In 2017, the **Strategy of Action 2017–2021** began structural reforms, emphasizing energy intensity reduction and expansion of renewables. In 2019, key laws were passed: the *Law on Renewable Energy Sources* (May 2019) offers tax, customs and other incentives for renewable projects, and a *Public-Private Partnership (PPP) Law* (May 2019) facilitates private investment in infrastructure, including power plants. The Legal and regulatory framework was further strengthened by the *Law on Investment Activities* (Dec 2019) and decrees on energy efficiency (e.g. Aug 2019 decree mandating 25% renewables by 2030) and smart grids.

Uzbekistan's long-term strategies highlight renewables. The **Strategy for Innovative Development 2019–2021** (adopted Sept 2018) set a goal of ≥20% renewables by 2025. In October 2019, the **Green Economy Transition Strategy 2019–2030** was adopted. It aims for an even higher renewable share (>25% by 2030) and calls for widespread modernization and clean technology adoption. In May 2020, a **Concept Note for 2020–2030** was approved, specifying that Uzbekistan should increase total capacity from 12.9 GW (2019) to 29.2 GW by 2030, and raise generation to 120.8 TWh by 2030. Crucially, it quantified renewable targets: 5 GW solar and 3 GW wind by 2030. Updated Ministry of Energy plans (2021–22) call for 4 GW each of solar and wind by 2026 and consider raising 2030 targets to 7 GW solar and 5 GW wind.

Additional policies support deployment and modernization. A 2019 **Decree on Energy Efficiency** set the 25% by 2030 renewable share and provided subsidies for energy-saving investments. The **Programme of Measures for Hydropower 2017–2021** addresses modernization of existing hydro

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,
2024-6.875 ResearchBib IF: 9.948 / 2024

plants. Regulatory reforms – unbundling state utility Uzbekenergo in 2019–2020, establishing competitive auctions, and improving PPA/tariff frameworks – aim to attract investors. The government has also launched net-metering programs to allow businesses and households to sell surplus solar power to the grid. In summary, Uzbekistan has created a robust policy framework (laws, strategies, and targets) to modernize its energy sector toward renewables.

Current Modernization Efforts in Solar and Wind

Uzbekistan has moved rapidly from near-zero renewables to dozens of utility-scale projects under construction or operation. Competitive bidding platforms (e.g. IFC's Scaling Solar program) have attracted global developers. **Solar photovoltaic (PV)** has led the way. The country's first large PV plant (100 MW, Navoiy, by Masdar) began operation in 2021, with PPAs at record-low tariffs. By 2024, several large PV projects came online: for example, two 220 MW solar parks in Jizzakh and Samarkand (built by Masdar/IBL and local partners) became operational. In total, as of October 2024 the Ministry of Energy reports 9 solar power plants (SPPs) with **solar capacity in the GW range**; by April 2025 this had grown to 11 solar PV plants. The annual generation from solar in 2024 reached about 4.86 TWh, up sharply from 0.434 TWh in 2022 and 0.577 TWh in 2023.

Wind power is now undergoing a similar scaling. In 2022–2023, small pilot wind farms came online, but the first **utility-scale wind farm** was Zarafshan (500 MW) inaugurated in late 2024. This flagship project – developed by Masdar (UAE) in partnership with PowerChina – installed 106 turbines (500 MW connected). It is the largest in Central Asia, supplying up to 500,000 households and cutting about 1.1 million tons of CO_2/year. Concurrently, other wind plants are in progress. The PowerChina press release notes a total capacity of 521.7 MW for Zarafshan, and by 2025 Uzbekistan has four wind farms totaling over 2 GW under contract. As of April 2025, official data show **11 solar and 3 wind plants** (4.06 GW combined capacity) operating; by August 2025 Uzbekistan reports **11 solar and 4 wind plants, 4,119 MW total capacity**. (The additional wind plant by mid-2025 likely includes Zarafshan and another smaller farm.)

These projects already have measurable impact. For example, solar+wind generation hit 2.0 TWh in Q1 2025 and 1.246 billion kWh in July 2025 alone (17% of national output). Annual renewable generation (including hydro) reached 27% of production in mid-2025. By August 2025 total solar+wind generation had exceeded 6 TWh for the year. In the process, about 633 million m^3 of natural gas is saved and roughly 1.88 Mt CO_2 avoided by July 2025.

Concrete examples illustrate this modernization:

- *Khorezm 100 MW (2025).* The World Bank and EBRD are supporting a new 100 MW solar project by Voltalia, to be commissioned in Nov 2025. It will generate ~240 GWh/year and displace 230,000 tCO_2 annuallyworldbank.org.
- *Samarkand 440 MW (2024).* Two solar parks (220 MW each) in Samarkand and Jizzakh (Masdar-led) came online in 2024worldbank.org.
- *Navoi 100 MW (2021).* The first competitive project, cited aboveibanet.orgworldbank.org.
- *Namangan 150 MW (2024).* Solar PV with storage, completed by Masdar's partnersiea.org.
- *Sherabad 457 MW (2025).* The first phase of the Sherabad solar park (Masdar) is under construction; planned tariff ~1.79 USc/kWh (2022 tender)iea.org.
- *Wind 500 MW Zarafshan (2024).* As noted. Another smaller wind farm is under way, bringing total wind capacity to nearly 1 GW.

In sum, Uzbekistan's current efforts involve building state-of-the-art solar PV and wind farms through public-private partnerships. These projects use modern thin-film and crystalline PV modules, and

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-5, ISSUE-8

large multi-MW turbines, to vastly increase renewable output in a short time. The accompanying infrastructure upgrades (new substations, transmission lines) are also being implemented under the **Network Development Master Plans** to accommodate the new variable generation.

Future Plans and Projections

Looking ahead, Uzbekistan's plans remain very ambitious. The **Electricity Supply Concept 2020–2030** targets *29.3 GW* total capacity (from 12.9 GW in 2019) and *120.8 TWh* generation by 2030. For solar and wind specifically, various official documents agree on multi-GW goals: roughly *8–12 GW* combined by 2026–2030. For example, the Ministry of Energy has set 8 GW by 2026 (5 GW solar, 3 GW wind). By 2030 some sources say **20–25 GW** renewables capacity (including hydro) will be in place, supplying around 40% of electricity. In practice, *state plans aim for ~5 GW solar, 3–5 GW wind, and ~2 GW hydro* by 2030, to yield roughly 10–15 TWh of clean energy and permit exports of 10–15 TWh to neighbors. Advanced modeling studies (e.g. WB, ADB, IEA) also suggest that meeting COP26 goals (35% CO_2/GDP by 2030) requires achieving 8 GW wind+solar by 2026.

Foreign partnerships and financing form a core of these future plans. As noted, *Masdar* (UAE) is committing ~$2 billion to projects (>2 GW) and pursuing deals (e.g. pipeline of 4 GW including a new 1 GW wind farm in Mingbulak). Chinese companies (PowerChina, Wasion, CEFC etc.) are active – for instance, PowerChina's Zarafshan project and multiple solar deals. The World Bank Group (IBRD/IFC) and EBRD plan dozens of auctions and guarantees: since 2020 they have supported ~1,000 MW solar and 500 MW wind. A new Samarkand project (ADB financed) will add 500 MW PV plus 668 MWh battery storage in 2025–26. International funds (e.g. Asian Infrastructure Investment Bank, Green Climate Fund) are being tapped for grid upgrades and storage. Nuclear energy is also entering plans: Uzbekistan is building a 330 MW nuclear plant (6×55 MW reactors) with Rosatom, to start by 2029.

In terms of technology, plans call for *advanced grid features* (smart meters, forecasting, and controls) and *storage systems* to integrate high VRE shares. The government, with donor support, is developing a national grid code and piloting advanced metering. Large Battery Energy Storage Systems (BESS) are explicitly planned: a 63 MW/126 MWh BESS in Bukhara (first in Central Asia) is under construction, and an ADB-financed 668 MWh BESS in Samarkand is forthcoming. Finally, a presidential decree is drafting a **hydrogen strategy**: joint ventures with companies like Saudi ACWA, US Air Products and Siemens Energy will develop renewable hydrogen and power-to-X projects. These efforts indicate Uzbekistan's intent to harness technical innovations (e.g. PV+storage, smart grid, hydrogen) at scale.

Foreign Investments and International Partnerships

International capital and expertise are critical for Uzbekistan's renewable modernization. Foreign direct investment has flowed via PPPs and auctions. Major partners include:

- **Masdar (UAE)**: Built Uzbekistan's first PV plants and the 500 MW Zarafshan wind farm. Masdar's investment pipeline (>2 GW) and commitments (~$2bn) reflect a deep strategic partnership. In late 2024, Masdar and Uzbek Energy signed MOUs (e.g. 1 GW Mingbulak wind farm) demonstrating long-term engagement.
- **World Bank Group (IBRD/IFC)**: Through its Scaling Solar and Guarantees programs, the World Bank has underwritten payment guarantees and PPAs for solar PV plants. It financed the first 100 MW Navoi plant and is guaranteeing the 100 MW Khorezm (Voltalia) plant. To date (by 2024) the World Bank/IFC has mobilized ~$80M+EBRD for solar and initiated 1 GW of wind projects.

VOLUME-5, ISSUE-8

- **EBRD and ADB**: These IFIs provide loans and technical assistance. ADB is co-financing large projects (e.g. 500 MW Samarkand PV+BESS) and grid modernization. EBRD helped rehab hydropower and provide equity (e.g. Tashkent HPP) and invests in CCGT for gas-plants transition.
- **China**: Chinese state-owned enterprises (PowerChina, Sinohydro, China ExIm Bank) are involved in multiple solar and wind projects, and funding for hydro modernization. For example, the 500 MW Zarafshan wind farm was built by a joint Chinese-Uzbek consortium (POWERCHINA-led).
- **Others**: European and local developers (TotalEren, Phanes, SEPCO, EREN, CAMC, TERNA) have won tenders. The IFC advises on tender structuring (Uzbekistan was first in Central Asia to join IFC Scaling Solar). Technical partnerships include Siemens (for turbines and grid tech) and local Uzbek firms (e.g. JSC "Thermal Power Plants").

These partnerships bring advanced technology (e.g. high-efficiency PV modules, >3 MW wind turbines) and financial muscle, while also building local capacity. For instance, the Voltalia project includes local joint ventures, and Masdar's contracts include maintenance training for Uzbek engineers. International donors also help with reform: the World Bank and ADB are advising on tariff reform and market design. In sum, Uzbekistan's renewable expansion is deeply integrated with foreign investment and global clean-energy programs.

Technological Innovations

Modern technology is central to Uzbekistan's renewal. In **solar PV**, plants use modern modules and tracking systems. New auctions have seen module efficiencies above 20% and competitive prices (as low as 2.7 USc/kWh in 2019). Central Asia's first large-scale **BESS** (63 MW/126 MWh in Bukhara) is under construction with World Bank guarantee; it will store solar energy to smooth output. ADB's Samarkand project will add a 668 MWh BESS – the largest in the region – alongside 500 MW PV. These storage systems exemplify the push for state-of-the-art grid flexibility.

In **wind power**, Uzbekistan is deploying modern onshore turbines (2–3+ MW each). The Zarafshan project used 106 high-capacity units to reach 500 MW. Turbines have advanced control systems for grid support. The Masdar projects have also trialed predictive maintenance and remote monitoring. Other innovations include:

- **Smart grid and meters:** The Energy Efficiency decree and Strategy emphasize network automation and smart metering. A pilot advanced metering infrastructure (AMI) project has been funded to install ~1.2 million smart meters, enabling better demand response and loss reduction.
- **Digital platforms and forecasting:** New dispatch software is being introduced to manage variable renewables. Satellite-linked weather forecasting systems help predict solar/wind output.
- **Renewable heating and mini-grids:** Smaller-scale solar solutions (e.g. off-grid PV for rural pump stations, solar water heating) are being promoted under social programs (as noted by strategy).
- **Hydrogen and Green Fuels:** Uzbekistan is entering the hydrogen economy. A presidential decree will define measures to support renewable-derived hydrogen. MoUs signed with ACWA (Saudi) and Air Products (US), plus Siemens Energy, aim to develop pilot green hydrogen production and related projects. Although still early-stage, these illustrate forward-looking tech adoption.

Together, these innovations (from PV and wind hardware to grid-smart controls and storage) are modernizing Uzbekistan's energy infrastructure. They make the new plants more efficient, reliable,

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-5, ISSUE-8

and easier to integrate. For example, embedding BESS and smart controls can mitigate the intermittency of solar/wind, supporting the country's aggressive renewable targets.

Challenges and Solutions

Uzbekistan's rapid renewables expansion faces several challenges, which policymakers are actively addressing:

- **Grid Infrastructure:** The existing grid requires upgrading to handle high solar/wind inputs. Transmission and distribution lines need reinforcement to avoid bottlenecks and losses. *Solution:* The government has adopted a 2025 Electric Networks Development Strategy and is working with ADB and WB to modernize the grid. Expansion of substations and high-voltage links is underway, and smart-grid systems (real-time controls) are being piloted.
- **Financial Requirements:** Building ~8–12 GW of renewables by 2030 demands vast capital. In 2023 alone Uzbekistan planned ~$15.4 billion in renewables investments, with ~$13.4 billion via PPPs. *Solution:* The government relies on PPP frameworks and IFI funding. It guarantees PPAs (World Bank guarantee for Voltalia) and offers tax incentives under the 2019 RE law. Foreign investors are securing low-cost financing (e.g. EBRD loans for Khorezm solar). Continued policy stability and attractive auctions are needed to draw more private capital.
- **Variability and Storage:** Solar and wind are intermittent. Without mitigation, high VRE shares can cause curtailment or grid instability. *Solution:* Deploying energy storage (like the new BESS projects) buffers fluctuations. The grid operator is improving forecasting and using flexible gas turbines to balance supply. Long-term, pumped hydro (Uzbekistan has huge hydro potential) and demand-response programs will help.
- **Regulatory/Administrative Hurdles:** Early on, obtaining permits, land allocation, and curtailment rules were unclear. *Solution:* Uzbekistan has streamlined approvals and introduced auctions. The PPP law and recent tariff regulations give investors more certainty. The state has also allowed independent power producers to connect to the grid on defined terms, reducing bureaucracy.
- **Local Capacity and Technology Transfer:** Building advanced plants requires skilled engineers and maintenance crews. *Solution:* The government has initiated training programs (often via World Bank/IFC) to develop local technical expertise. Foreign developers (Masdar, Voltalia, Siemens) commit to training transfer. Over time, Uzbekistan aims to develop an OEM supply chain (e.g. for mounting structures and blades) to enhance domestic industry.

By addressing these challenges through planning and partnerships, Uzbekistan is putting solutions in place. For example, recognizing grid needs led to the Transmission Development Plan (with WB support) and distribution masterplan (with ADB support) currently being finalized. Likewise, fast-track legislation in 2019–2020 overcame earlier administrative bottlenecks.

Quantitative Data and Illustrations

Recent data underscore the trends above. By late 2024, **11,954 MW** total generation capacity was reported across thermal (9 plants), solar (9 plants), and wind (7 plants), with renewables (solar+wind) constituting nearly 25% of that. To illustrate growth: solar PV output jumped from 0.434 TWh in 2022 to 4.86 TWh in 2024. Wind output for Jan–April 2025 (0.830 TWh) already exceeded all of 2024 (0.799 TWh). These numbers show that renewable generation is on a steep upward trajectory. (The accompanying figures image solar panels and turbines to visualize this expansion.)

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,
2024-6.875 ResearchBib IF: 9.948 / 2024

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-5, ISSUE-8

By contrast, fossil generation and gas consumption are expected to decline as renewables ramp up. The 2020 concept foresaw reducing gas use in power from 16.5 to 12.1 billion m³ by 2030. Early evidence is visible: July 2025 renewables generation alone saved ~378 million m³ gas.

A quick summary of key quantitative highlights:

- **Capacity (2025):** ~4.1 GW solar+wind (in 15 plants)caspianpost.com (vs ~0.1 GW in 2019).
- **Generation (2024):** ~4.86 TWh from solar+windcaspianpost.com (from <0.5 TWh in 2022).
- **Targets:** 8 GW solar+wind by 2026 (22.7 TWh, save 8.8 bn m³ gas)ouzbekistan.fr; ~25 GW by 2030 (40% share) worldbank.orgenergyglobal.com.
- **Investment:** US$15.4 bn in renewables planned for 2023 alone enerdata.net, mainly via PPPs.
- **Emissions:** Each TWh of clean electricity avoids ~1.5 bn m³ of gas and 1.8 Mt CO_2 (Uzbekistan averages). By mid-2025, ~2.1 Mt CO_2 were avoided from renewables.

These data demonstrate that Uzbekistan's renewable modernization is both large-scale and accelerating, with clear metrics showing progress toward its goals.

Conclusion and Recommendations

Uzbekistan is rapidly transforming its energy infrastructure. From an almost entirely gas-based system in 2016, it is now building dozens of modern solar and wind power stations and aiming for gigawatts more. This transition is driven by clear policies (renewable laws, strategies, targets) and backed by substantial foreign investment and IFI support. The country is on track to meet its near-term goals (25% renewables by mid-2020s) ahead of schedule, and is laying the groundwork for the longer-term targets of 40% by 2030 and carbon neutrality by 2050.

For students and policymakers, the following lessons and actions are recommended:

- **Continued Policy Support:** Maintain a stable, transparent regulatory framework. Ensure that auctions and incentives remain attractive. Policymakers should regularly review and adjust targets (e.g. raise them if progress allows) as the *Concept 2020–2030* suggests updating.
- **Grid Modernization and Flexibility:** Prioritize completion of transmission and distribution upgrade plans. Invest in digital monitoring and demand-response programs so that variable generation can be accommodated reliably.
- **Energy Storage and Innovation:** Encourage deployment of batteries and other storage (including pumped hydro) to maximize renewable use. Support pilot projects in hydrogen and solar thermal to diversify technology.
- **Workforce Development:** Expand technical training in renewables. Universities and vocational schools should include solar/wind engineering in curricula. Leverage international partnerships (e.g. Siemens, Masdar) for skill transfer.
- **Local Industry Promotion:** Explore opportunities to develop a local renewable supply chain (e.g. PV mounting systems, turbine assembly). Offer R&D incentives and facilitate joint ventures so that technology manufacturing benefits Uzbekistan.
- **Regional Cooperation:** Given plans to export power, strengthen cross-border grid links (e.g. with Afghanistan or China) and align market rules. Engage in regional dialogues for energy trade.

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,
2024-6.875 ResearchBib IF: 9.948 / 2024

VOLUME-5, ISSUE-8

- **Monitor and Adapt:** Use data-driven planning (as done for the carbon-neutral roadmap) to adjust strategy. Encourage research on Uzbekistan's unique resources (high insolation, windy plains) and ecological conditions to optimize project siting and design.

In summary, Uzbekistan's clean energy modernization is a case of rapid scale-up underpinned by strong policy and international collaboration. If the country continues on this path – addressing technical challenges and nurturing innovation – it should achieve a diversified, sustainable energy system within the next decade. Policymakers should reinforce what is working (public-private tenders, incentives) and address bottlenecks (grid, financing) to ensure renewable growth is smooth and inclusive. **Students and analysts** can support this transition by studying renewable technologies and policy, engaging in regional energy forums, and contributing to data analysis that tracks Uzbekistan's progress toward its ambitious targets.

Sources: Official government and international agency documents and reports (IEA, World Bank, Ministry of Energy Uzbekistan, IRENA, etc.) have been used throughout to provide data and context. These cover Uzbek energy plans (e.g. 2017–2030 strategies, concept notes) and recent project statistics (e.g. generation output, installed capacities). Data from 2022–2025 sources (news releases, press reports, IFI press releases) have been cited to reflect the current state and trends.
