PEDAGOGUE AND VALUE SYSTEM

Rakhmonova Nigina Aminjonovna
Independent researcher at Nizami Tashkent State Pedagogical University

Abstract. Values are a set of values, rules, traditions and characteristics that occupy a special place in the worldview, are considered one of the most ancient concepts in the human mentality. Along with social views and understandings, values are also considered the most stable intellectual development of humanity. They were formed over many thousands of years and were formed by each people in the form of special words and concepts.
Keywords: value, national value, universal human value, pedagogical activity, communication, self-concept, education.

Аннотация. Ценности – это совокупность ценностей, правил, традиций и характеристик, занимающих особое место в мировоззрении, считающихся одними из древнейших концепций в человеческом менталитете. Наряду с общественными воззрениями и представлениями, ценности также считаются наиболее устойчивым интеллектуальным развитием человечества. Они формировались на протяжении многих тысячелетий и оформлялись каждым народом в виде особых слов и понятий.
Ключевые слова: ценность, национальная ценность, общечеловеческая ценность, педагогическая деятельность, общение, Я-концепция, образование.

Введение. Профессиональное образование как средство развития личности представляет собой педагогическую деятельность, коммуникативное действие, коммуникативную технологию и субъектное действие педагога, которое объединяет все аспекты этого действия и подразделяется на группы: компетентность-средство, компетентность-отношение и компетентность-знание.

Ценности – это отношения, обеспечивающие взаимодействие с субъектом в педагогическом процессе. При этом отношение педагога к себе и его отношение к личности сбалансированы. Объективные ценности являются средствами ценностей, а реляционные – ценностями цели и качества.

The national and universal value system "I" consists not only of cognitive, but also of emotional-volitional components inherent in the work orientation, as a system of value orientation. It is embedded in pedagogical values, which are the basis of the individual system, as well as socio-pedagogical and professional-group values.

Literature analysis. Literature analysis shows that a person's orientation to values is related to both his conscious and unconscious defense mechanisms. The problem of the manifestation of psychological defense mechanisms in individuals has been widely studied by foreign psychologists. Including foreign psychologists and sociologists, A. Willi, E. Durkgeym, P. Jane, T. Schrauber, K. Buhler, V. Metuuza, DJ Bruner, S. Hall, U. Djeyms, D. Sheyni, E. Clapared and a number of works have been carried out in this field by many other researchers[1].

In psychoanalytic theory, psychological defense mechanisms were the focus of research by Z. Freyd, A. Freyd, E. Fromm, K. Horney and others. Z. Freyd first used the term "defense" in his work "Defensive Neuropsychoses". Keinshalik used it in his work "The Etiology of Hysteria". In these

works, Z. Freyd fully expressed the purpose and content of the defense mechanism[2]. He postulated that the emergence of social cooperation, which consists in the release of the intropsychic conflict, is conditioned by the contradictions between the instinctual impulses of the unconscious and the interrelated demands of the external environment. He continued his work in the articles "The Concept of Depression", "Beyond the Pleasure Principle", "Popular Psychology" and "The Analysis of the Ego", "The Ego" and "It". In addition, special understandings have been introduced into other defense mechanisms used in the current scientific literature. In this way, the purpose of phenomenology and the subject of psychological defense have been clarified. Thus, psychological defense mechanisms are activated when they are involved in the valued habits and characteristics of the individual. This process begins in two ways: unconsciously and consciously[2].

Results and analysis. A person's complete understanding of national values involves psychological defense mechanisms when these values are violated. A particularly intense and scientifically based thought and reasoning on these problems are contained in Z. Freyd's article "Formal and Uncertain Analyses".[3] This article considers the development and development of the defense mechanism as a process of dialectical generalization of internal and external conflicts and the control of individual behavior (as a general name for all mechanisms). These phenomena are associated with the basic functions of the psyche, such as coordination, stabilization and control.

A. Freyd's views from the views of Z. Freyd in his latest works did not make a significant difference. His research aimed to develop a general theoretical system of defense mechanisms. In his fundamental monograph, published in 1936, he gave detailed information about the various methods of defensive actions[4].

According to A. Freyd, defense mechanisms are based on two types of reactions:[4]

1. Blocking the manifestation of impulses in conscious action;
2. They must be so distorted that the former the intensity of which decreases sufficiently and flows in the other direction.

A. Freyd, summarizing his research, gives the following definition of defense mechanisms: defense mechanisms are the activities of the “I”, which, if they pose a threat to it, become ineffective when the “I” becomes too active and can fall into the corresponding affects. That is, they function without the consent of the conscious mind.

In this understanding, the important idea of bringing the so-called automatic defense to the corresponding type of unconscious events is put forward. Accordingly, in organizing the defense mechanisms, it is appropriate to raise the question of comparing the conscious with the unconscious. Then the thought of the mind becomes operational, becomes stronger and acquires the characteristics of a conditioned reflex, stable automatic.

The followers of Z. Freyd's theory, A. Freyd, K. Levin, T. Shibutani, tried to clarify the goals and functions of psychological defense. The theories of F. Bassin, A. G. Rotenberg established the importance of the psychological defense mechanism in the development of the individual, and in particular, emphasized that it ensures the normal functioning of the human psyche in preventing mental stress in a person[3].

Sigmund Freyd was one of the first to identify many types of defenses and suggested that these mechanisms operate unconsciously.

So, if we generalize these scientific considerations, the hypotheses put forward by foreign and Russian psychologists are that the content, structure, types, functions and principles of the psychological apparatus of a person are related to his value system. A person defends his or her own

system of values, both consciously and unconsciously. This knowledge allows us to study the psychological factors of the formation of national values in students.

Conclusion. Analysis of the literature on the topic: psychological factors in the formation of national values in students: family values, principles of family upbringing, human and universal values in the educational process, aspirations and aspirations of people in society, worldviews, demands of time and place, cartoons, TV shows, films broadcast in the mass media, and individual psychological characteristics of the individual, conscious and showed that unconscious defense mechanisms are connected.
