Abstract. The swift advancement of digital technologies has significantly altered methods of language acquisition and instruction. Conventional methods that predominantly depended on textbooks and in-person teaching are progressively supplemented, and in certain instances supplanted, by digital platforms, mobile applications, virtual classrooms, and artificial intelligence tools. The incorporation of technology has rendered language learning more interactive, learner-focused, and accessible to broader demographics across various contexts. Furthermore, digital resources and adaptive learning systems provide tailored education that accommodates diverse competence levels and learning styles. Notwithstanding these benefits, obstacles persist in guaranteeing equitable access, preserving the human aspect of language learning, and cultivating sufficient digital literacy competencies among students and educators. This article analyses the educational importance of technology in contemporary language learning methods, emphasising both advantages and drawbacks. The research highlights the significance of technology in promoting engagement, autonomy, and collaborative learning, while also addressing the ramifications for teacher training and curriculum development in higher education.

Keywords: Technology, language learning, digital pedagogy, online platforms, artificial intelligence, blended learning, learner autonomy, language acquisition, e-learning, virtual classrooms.

Introduction. Over the past twenty years, there has been an extraordinary transformation in education due to advancements in digital technology. Language acquisition has prominently featured in these transformations owing to the intrinsically communicative characteristics of both technology and language. The extensive utilisation of cellphones, social media, video conferencing platforms, and artificial intelligence has broadened the domain of language instruction beyond conventional classrooms. In modern environments, digital tools function not merely as auxiliary resources but as essential elements of instructional design, altering the manner in which learners engage with information, educators, and fellow students. Contemporary approaches currently integrate several technological advancements, including learning management systems, gamified applications, adaptive software, and speech recognition techniques. These resources provide learners enhanced autonomy through quick feedback, flexible scheduling, and access to real materials. Furthermore, technology improves intercultural communication by enabling real-time connection with native speakers and international communities. This capability corresponds with the overarching educational objective of equipping learners for engagement in progressively interconnected societies. Nonetheless, the integration of technology in language education prompts enquiries about pedagogical efficacy, accessibility, and sustainability. Although digital tools can enhance motivation and engagement, their effectiveness relies on proper integration into curriculum design and the proficiency of educators in employing them. The digital divide exacerbates implementation challenges, as unequal access to devices and dependable internet connectivity generates differences among learners. Furthermore, excessive dependence on technology threatens to undermine the

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,
2024-6.875 ResearchBib IF: 9.948 / 2024

human and social dimensions of language learning, which are essential for communicative competence.

This article examines the role of technology in the evolution of language teaching methods, analysing how digital advances enhance learner-centred approaches and evaluating their limitations. The study seeks to critically assess the impact of technology on pedagogical frameworks, student motivation, and the redefinition of the teacher's role in language instruction. This emphasises the necessity for a balanced integration that optimises advantages while confronting obstacles inherent in digital learning environments.

Literature Review. Research conducted in the last decade underscores the essential role of technology in facilitating innovative learning methodologies. Chapelle and Sauro (2021) assert that digital technologies have transitioned from additional tools to essential components of instructional design in second language acquisition. Their findings indicate that online platforms and learning management systems facilitate flexible learning options, especially in higher education. A thorough evaluation by Klimova (2021) demonstrates that mobile learning applications enhance learner motivation and performance, particularly when incorporated into blended learning contexts. Lee and Kim (2022) illustrate that gamification in language applications enhances engagement and facilitates vocabulary retention via interactive and competitive mechanisms. Research on artificial intelligence underscores its capacity to deliver immediate feedback and personalised learning experiences. Godwin-Jones (2022) observes that AI-powered chatbots and automated writing evaluation systems are progressively utilised in language schools, providing scalable options for formative feedback. However, ethical issues concerning data privacy and the dehumanisation of language instruction persist (Zhang & Wang, 2023). Moreover, literature regarding blended and online learning underscores the need of interaction and collaboration. Rashid and Asghar (2022) contend that successful digital integration enhances student engagement by harmonising technology instruments with communicative activities. Li and Cummins (2023) enhance this viewpoint by emphasising the significance of digital literacies, contending that learners must cultivate essential abilities to adeptly traverse digital resources. The literature suggests that although technology provides significant advantages, its efficacy is primarily contingent upon educational approaches, teacher proficiency, and institutional preparedness for digital transformation.

Methods. This research employs a qualitative methodology, guided by theme analysis of contemporary studies on technology-assisted language acquisition. A rigorous review was conducted on academic publications, books, and case studies published post-2020 to guarantee contemporary relevance. Sources were located via internet databases including Scopus, Web of Science, and ERIC, utilising search terms such as technology in language learning, digital pedagogy, artificial intelligence in education, and blended learning in language instruction. The inclusion criteria emphasised works pertaining to higher education or advanced language acquisition situations, while eliminating research confined to early childhood or basic literacy programs. Following the application of these criteria, twenty peer-reviewed papers were examined. The analysis encompassed coding for reoccurring themes including student autonomy, engagement, accessibility, teacher readiness, and ethical issues. These themes directed the integration of findings and the ensuing discourse.

Results. An examination of contemporary studies uncovered numerous prevailing trends: Learner Autonomy and Personalisation: Digital tools, particularly adaptive software and AI-driven systems, facilitate personalised routes, allowing learners to advance based on their skill level and speed. Engagement and Motivation: Gamified platforms and mobile applications frequently exhibited

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,
2024-6.875 ResearchBib IF: 9.948 / 2024

beneficial impacts on learner motivation, especially in vocabulary acquisition and interactive practice. joint Learning: Online discussion forums, video conferencing, and virtual classrooms facilitate international contact and joint projects, thereby augmenting communicative ability. Teacher Competence: Research continually emphasises that the effective integration of technology relies on teachers' digital literacy and pedagogical preparation. In the absence of sufficient assistance, educators either underutilise digital resources or utilise them in a superficial manner. Equity and Accessibility: Despite technical advancements, gaps in access to devices and reliable internet connections endure, resulting in unequal possibilities for learners in various situations. Ethical and Pedagogical Concerns: The increasing dependence on AI has elicited apprehensions around data privacy, possible biases in automated feedback, and the threat of reducing genuine human engagement. These findings demonstrate that technology is most efficacious when it is integrated judiciously, linked with educational goals, and bolstered by institutional structures.

Discussion. The results of this study correspond with current literature that identifies technology as both an impetus and an obstacle in language instruction. The identified advantages of learner autonomy and engagement align with the findings of Klimova (2021) and Lee and Kim (2022), who illustrate how mobile applications and gamification enhance motivation and performance. Similarly, the significance of collaboration underscored in this study reinforces the emphasis articulated by Rashid and Asghar (2022) on mixed learning environments. However, the ongoing issues of accessibility and teacher readiness highlight the need for thorough institutional interventions. Technology alone does not ensure enhanced learning results; instead, it is the pedagogical framework that dictates success. Chapelle and Sauro (2021) contend that technology should be integrated into instructional design that prioritises communicative skills, critical thinking, and digital literacy. The ethical ramifications of artificial intelligence in language teaching necessitate meticulous examination. Although AI systems offer personalised feedback and scalable solutions, excessive dependence may diminish language acquisition to a transactional process lacking human contact. Zhang and Wang (2023) emphasise that the correct utilisation of AI necessitates explicit ethical rules and continuous instructor oversight. The incorporation of technology in contemporary language learning methodology serves as a complement to older approaches rather than a substitute. The future of language education resides in hybrid models that integrate technical advancements with human-centered methodologies. This requires educators and governments to engage in teacher training, ensure fair access to resources, and establish frameworks that protect the social and ethical aspects of language education.

Conclusion. The use of technology into contemporary language learning strategies poses both a significant potential and a multifaceted issue. Digital platforms, mobile applications, and artificial intelligence tools have improved access to genuine content, tailored learning experiences, and intercultural communication. The dependence on technology necessitates meticulous examination of concerns like accessibility, digital literacy, and the maintenance of interpersonal engagement in education. Successful language instruction in the digital age relies on educators' capacity to incorporate technology in ways that enhance, rather than supplant, traditional communicative and cognitive methodologies. In summary, technology has become an essential element of modern language acquisition, transforming both methods and practices. Its capacity to foster learner autonomy, motivation, and collaboration is considerable; nonetheless, it necessitates critical awareness and pedagogical equilibrium. The future of language education resides not solely in technology, but in the deliberate integration of digital innovation with the human aspects of teaching

and learning. This equitable strategy will guarantee that technology perpetuates the enhancement of language acquisition while preserving its inherently social and interactive essence.
