The impact of the construction sector on regional gross domestic product: an economic analysis(Khorezm region)

Norbayev Jamol Baxadirovich
Shiddat Capital MChJ director

Abstract: This study examines the role of the construction sector in driving the Gross Regional Product (GRP) of Uzbekistan's Khorezm region, utilizing recent statistical data from 2025. The analysis reveals that the construction sector accounts for approximately 8.7-9.4% of the region's GRP, with robust growth rates exceeding 110% in the first nine months of 2025. Through direct contributions to output and indirect effects on related industries, construction significantly influences regional economic expansion, contributing notably to overall GRP growth amid Uzbekistan's broader infrastructure development initiatives. The findings underscore the sector's potential as a key driver for sustainable regional development.

Keywords: Construction sector, Gross Regional Product (GRP), Khorezm region, Economic impact, Uzbekistan, Sectoral growth, Infrastructure development

Introduction: The Khorezm region, located in northwestern Uzbekistan, is characterized by a diverse economy with strong agricultural roots, supplemented by growing industrial and service activities. As Uzbekistan pursues ambitious economic reforms under strategies like "Uzbekistan-2030," regional disparities in growth have highlighted the need for sector-specific analyses. The construction sector, fueled by investments in housing, transportation, and energy infrastructure, has emerged as a pivotal element in regional economies. This paper provides an economic analysis of how the construction sector influences the GRP of Khorezm, drawing on official statistics to assess its direct and indirect impacts.

Relevance of Work

Understanding the construction sector's impact on GRP is crucial for policymakers in Uzbekistan, particularly in less industrialized regions like Khorezm, where agriculture dominates but faces vulnerabilities from climate and market fluctuations. This work is relevant amid ongoing national efforts to diversify economies and enhance infrastructure, as seen in presidential reports on Khorezm's progress. By quantifying the sector's contributions, this analysis aids in informed decision-making for investment allocation, job creation, and sustainable growth, addressing gaps in region-specific economic studies.

Purpose

The primary purpose of this study is to evaluate the quantitative and qualitative impacts of the construction sector on the GRP of the Khorezm region. Specifically, it aims to measure the sector's share in GRP, analyze its growth dynamics, and discuss broader economic implications, including multiplier effects on employment and related sectors.

Materials and Methods of Research

Data for this analysis were sourced from the State Committee of the Republic of Uzbekistan on Statistics (Stat.uz), including quarterly and cumulative reports for 2025. Key datasets include GRP volumes, sectoral breakdowns, and growth rates for the first quarter (Q1), first half (H1), and first nine months (January-September) of 2025. The methodology employs descriptive statistics to outline sectoral shares and growth rates. To assess impact, the contribution to GRP growth is calculated using the formula: Sectoral Contribution (percentage points) ≈ (Sector Growth Rate - 100) × (Sector Share

in Previous Period) / 100, approximated from available data. Qualitative insights are drawn from national economic trends and regional development reports.

Results and Discussion

The Khorezm region's economy demonstrated steady growth in 2025, with GRP reaching 10,851.5 billion soums in Q1 (growth of 106.8%), 26,774.5 billion soums in H1 (growth of 107.4%), and 44,142.6 billion soums in January-September (growth of 107.3%). The construction sector consistently played a significant role, as detailed below.

Sectoral Composition and Growth

The following table summarizes the construction sector's performance relative to other sectors in Khorezm for key periods in 2025:

Period	Total GRP (billion soums)	Construction Volume (billion soums)	Construction Share (%)	Construction Growth Rate (%)	Overall GRP Growth Rate (%)
Q1 2025	10,851.5	937.7	8.6	110.4	106.8
H1 2025	26,774.5	2,515.1	9.4	114.0	107.4
Jan-Sep 2025	44,142.6	3,846.5	8.7	110.1	107.3

Agriculture, forestry, and fisheries remain the largest sector (23.1-32.7% share), but construction's growth outpaced the regional average in all periods, indicating its dynamism. For instance, in H1 2025, construction grew by 114.0%, compared to 103.9% for agriculture and 109.2% for industry.

Impact on GRP Growth

The construction sector's contribution to GRP growth can be estimated by its weighted growth effect. In January-September 2025, with an 8.7% share and 110.1% growth rate, the sector contributed approximately 0.88 percentage points to the overall 7.3% GRP growth (calculated as: (110.1% - 100%) × 8.7% ≈ 0.88 pp). This is substantial, especially when compared to national trends where construction contributed 0.8 pp to Uzbekistan's GDP growth in the first half of 2025. The sector's expansion is driven by investments in regional infrastructure, such as housing and transport projects, which align with Uzbekistan's broader construction boom (national growth of 10.7% in H1 2025).

Indirectly, construction stimulates related industries like manufacturing (e.g., building materials) and services (e.g., logistics), creating multiplier effects. Nationally, the sector accounts for 6-7% of GDP and employs over one million workers, suggesting similar employment benefits in Khorezm. However, challenges such as resource scarcity in Khorezm may limit further expansion without targeted policies. Compared to historical data (e.g., 5.8-6.7% share in 2019-2021), the sector's share has increased, reflecting post-reform investments.

Conclusion

The construction sector exerts a positive and growing impact on Khorezm's GRP, contributing 8.6-9.4% to the total and driving growth through high expansion rates. Its role extends beyond direct output, fostering economic diversification and employment in a region traditionally reliant on agriculture. To maximize benefits, policymakers should prioritize sustainable investments and address regional constraints. Future research could incorporate econometric models for deeper causality analysis.
