ABSTRACT

This article examines the impact of the digital economy on Uzbekistan's labor market and employment policy. Based on statistical data from 2020–2024, the paper analyzes the growth of employed population, the creation of new jobs in the digital sector, and the structural changes in employment by industry.

Keywords: digital economy, employment policy, labor market, IT sector, jobs, digital transformation, Uzbekistan.

1. INTRODUCTION

In recent years, the rapid development of the digital economy in Uzbekistan has had a significant influence on the labor market. New technologies, artificial intelligence, automation systems, and remote work formats are creating a new model of employment generation.

During 2020–2024, large-scale reforms were implemented to modernize employment policy under the framework of the *"Digital Uzbekistan – 2030"* strategy, the expansion of IT Parks, and the development of e-government systems.

The purpose of this study is to analyze the impact of the digital economy on the labor market and employment policy of Uzbekistan, identify key trends, and develop practical recommendations for improvement.

The research uses data from the **State Statistics Agency**, **IT Park Uzbekistan**, and the **World Bank** covering the years 2020–2024.

2. Research Methodology

The study applies a **descriptive and comparative analysis** based on official national and international datasets.

Indicators such as total employment, unemployment rate, and new jobs created in the IT sector are analyzed.

Graphical interpretation and trend analysis are used to assess the relationship between digitalization and employment growth.

Data sources include the **State Statistics Agency of Uzbekistan**, **IT Park Annual Reports**, and the **World Bank's Digital Economy Review (2023)**.

3. Employment Dynamics and Labor Market Trends (2020–2024)

Uzbekistan's labor market has shown stable growth in recent years.

According to the data, the total number of employed persons increased from **13.6 million in 2020** to **14.8 million in 2024**, meaning that approximately **1.2 million new jobs** were created. Meanwhile, the unemployment rate decreased from **10.5% in 2020** to **8.1% in 2024**, reflecting a positive trend associated with economic recovery, the expansion of the services sector, and the growth of digital employment opportunities.

Table 1. Employment and unemployment rate in Uzbekistan (2020–2024)[1]

Yil	Ishsizlik darajasi (%)	Umumiy band aholisi (mln)
2020	10.50	13.60
2021	9.80	13.90
2022	9.30	14.20
2023	8.70	14.50
2024	8.10	14.80

Figure 1. Trends in employment growth and declining unemployment (2020–2024)[2]

The most notable change occurred during **2022–2023**, when the unemployment rate fell from **9.3% to 8.7%**. This improvement was driven by new digital employment opportunities, the rise of remote work, and the expansion of small business and startup activity.

Government programs such as *"Yoshlar daftari"* (Youth Register), *"Ayollar daftari"* (Women's Register), and *"Tadbirkor ayol"* (Women Entrepreneur) also contributed significantly to inclusive employment growth, especially among youth and women.

4. Growth of Employment in the IT Sector

The IT sector has become one of the most active components of the digital economy. Between 2020 and 2024, the number of jobs created in the IT sector increased nearly **4.3 times** — from **12,000 in 2020** to **52,000 in 2024**.

Figure 2. Dynamics of new jobs created in the IT sector (2020–2024)[3]

This growth was driven by:

- expansion of digital infrastructure projects,
- the strengthening of IT Parks' operations,
- the spread of remote work systems, and
- the entry of international IT companies into the Uzbek market.

In addition, government and private initiatives such as **"One Million Uzbek Coders"**, **"IT-Talim"**, and **"Startup Initiative"** programs have played an important role in training qualified specialists and increasing employment levels in digital professions.

5. Conclusion

The digital economy has opened a new stage in Uzbekistan's labor market development. Between 2020 and 2024, jobs in the IT sector increased **fourfold**, while the unemployment rate declined by **2.4 percentage points**.

Going forward, employment policy should prioritize:

- the expansion of **digital skills and professions**,
- increased access to **IT education for women and youth**, and
- the promotion of **remote and flexible work formats** across regions.

These measures will ensure that the digital transformation process contributes effectively to sustainable employment and inclusive economic growth.
