Abstract: This article examines the methodology for developing creative competence among pre-service primary school teachers based on an integrative approach. The structural components of creative competence, the principles and stages of integrative methodology, and pedagogical mechanisms that support creative instructional practice are analyzed in depth. A methodological model designed to enhance creative pedagogical activity has been developed and theoretically justified. The proposed approach aims to improve the quality of primary education and contribute to the formation of a creative, innovative, and pedagogically flexible teacher identity.

Keywords: creative competence, integrative approach, primary education, creative methodology, innovative lesson design, reflection, modelling, creative task, pedagogical integration, creative thinking.

Introduction

In contemporary primary education, modern pedagogical approaches, innovative teaching methods, and integrative instructional technologies are becoming the foundation of the teaching–learning process. The creative competence of future primary school teachers constitutes one of the most essential components of their professional preparation. A creative approach strengthens pupils' personal development, enables teachers to make original pedagogical decisions, and enriches the lesson with innovative elements. Developing creative competence through an integrative approach is of both theoretical and practical significance. Its effective formation enriches the content of primary education and enhances learners' engagement and cognitive activity. Considering the psychological characteristics of younger schoolchildren particularly their natural curiosity and responsiveness to creative tasks the creative competence of the teacher becomes an indispensable element of the educational process.

Current research demonstrates that creativity occupies a leading position among teachers' personal and professional qualities. It not only fosters innovative thinking but also develops the ability to make flexible pedagogical decisions in various instructional situations. Therefore, cultivating creative competence is not limited to modifying teaching techniques; it requires rethinking the teacher's overall professional development strategy.

The implementation of an integrative approach in primary education ensures interdisciplinary coherence within the learning process. This, in turn, supports pupils in transferring knowledge from one subject to another, identifying logical connections, and applying learned concepts independently in real-life contexts. Such an approach enables teachers to broaden pupils' worldview, nurture their creative potential, and guide them toward independent inquiry and discovery.

The development of creative competence is closely intertwined with the teacher's methodological preparation. Consequently, the theoretical frameworks proposed by researchers such as Tvorogova,

VOLUME-5, ISSUE-11

Markova, Zeer, Khutorskoy, and Slastenin form the methodological basis of this study. Their perspectives emphasize that creative competence is not merely the ability to think innovatively; it also encompasses motivation, cognitive processes, pedagogical design skills, reflective analysis, and the capacity to make innovative instructional decisions. Furthermore, the significance of creative competence in primary education is particularly profound, as this stage shapes fundamental conceptual understanding, broadens imagination, and supports the emergence of independent and creative problem-solving skills. A teacher with strong creative competence can nurture pupils' natural curiosity, create a stimulating learning environment, and offer unconventional solutions. Therefore, developing creative competence among future primary school teachers through an integrative approach is considered one of the most pressing scientific and practical directions in modern education. This approach requires methodological and pedagogical renewal within teacher preparation programs and provides a strong foundation for cultivating creative, flexible, and innovative educators.

Methods

The study began with a systematic analysis of scholarly literature on creative competence, integrative education, innovative pedagogical approaches, creative thinking, and primary education methodology. This stage made it possible to clarify the essence of creative competence, reveal its structural components, and identify the theoretical foundations of the integrative approach. The theoretical analysis served as a basis for establishing a solid scientific–methodological framework for developing creative competence in future primary school teachers.

A comparative analysis was subsequently conducted. European competency models related to creative education, the 4C framework widely used in the United States, and the experiences of other advanced educational systems were compared with the national education standards of Uzbekistan. This comparison provided insights into ways international best practices can be adapted to local educational contexts for the effective development of creative competence.

One of the key directions of the research was the development of an integrative methodological model aimed at the gradual formation of creative competence. During the modelling process, the motivational, cognitive, practical, and reflective components of creative competence were examined individually, and their internal interrelationships were theoretically substantiated. The resulting model was designed as a practical tool for pre-service primary school teachers. To ensure scientific validity, the model underwent expert evaluation involving experienced methodologists and practising primary school teachers. Their analytical feedback addressed the model's content, practical effectiveness, and applicability to real classroom settings, which significantly contributed to refining and enhancing the model. A structural–analytical approach was also employed to examine the model's internal architecture. Creative task systems, integrative lesson designs, modelling techniques, and methodological tools that foster creative activity were analyzed in detail, enabling each component of the model to be elaborated as a distinct pedagogical mechanism.

Throughout the study, observations from primary school teaching practice, elements of methodological experimentation, and teachers' innovative strategies were examined. Integrative lessons, creative activity scenarios, and lesson designs implemented in real practice demonstrated the feasibility and practical relevance of the proposed model. These analyses confirmed that the methodology aligns well with actual educational conditions and supports the effective development of creative competence in future primary school teachers.

Results

During the study, a structural model of creative competence that meets contemporary scientific requirements was developed. This model consists of four core components: motivational, cognitive, practical, and reflective. The motivational component reflects pre-service teachers' interest in creative thinking and their desire for innovation. The cognitive component encompasses theoretical knowledge related to creative learning strategies, pedagogical innovation, and creative instructional approaches. The practical component was formed through activities such as synthesis, modelling, and generating creative solutions within the lesson process. The reflective component, in turn, characterizes teachers' ability to evaluate their own pedagogical actions, conduct analytical reflection, and enhance the quality of their creative decisions.

The principles underlying the process of developing creative competence through an integrative methodology were also identified. Ensuring interdisciplinary connections, teaching through creative tasks, applying problem-based learning, using visual modelling, and centering the learning process on pupil activity collectively formed the theoretical–practical foundation for fostering creativity in primary education. These principles demonstrated that lesson content becomes more meaningful, contextually relevant, and learner-centered when structured through an integrative approach. In addition, methodological mechanisms aimed at strengthening pre-service teachers' creative competence were developed. These include integrative lesson designs, a bank of creative tasks, modelling-based training sessions, didactic games, and reflection-oriented assessment criteria. Such mechanisms proved effective in activating the learning process, promoting independent thinking, and engaging students in creative activities. The findings revealed that developing creative competence through an integrative approach has a significant positive impact on the quality of primary education. When all components of the methodological model are applied in harmony, learners begin to develop qualities such as logical reasoning, imagination, independent decision-making, and creative problem-solving. Therefore, the proposed model serves as an effective theoretical and practical tool for preparing future primary school teachers for creative and innovative pedagogical activity.

Discussion

The findings of the study indicate that developing creative competence in pre-service primary school teachers is a complex, multi-component, and systemic process. This competence cannot be cultivated solely through the teaching of individual subjects; rather, it requires integrative, interdisciplinary, and activity-based learning environments. Such an approach necessitates the use of active teaching methods that not only provide theoretical knowledge but also guide learners toward creative thinking through modelling, observation, problem-based tasks, and creative instructional activities.

The creative competence model developed within the framework of the integrative methodology is distinguished by its universality, adaptability across subjects, and practical applicability in real teaching contexts. The model's motivational, cognitive, practical, and reflective components complement one another and collectively form a continuous mechanism for developing creative competence. Strengthening the practical component, in particular, encourages pre-service teachers to engage more deeply in creative instructional tasks such as lesson design, modelling activities, and the development of didactic games.

A comparison with the globally recognized 4C framework (Creativity, Critical thinking, Collaboration, Communication) demonstrates that the national model proposed in this study aligns with international standards for creative skills development. At the same time, the advantage of the

VOLUME-5, ISSUE-11

presented model lies in its integration of the distinctive features of Uzbekistan's educational standardssuch as interdisciplinary coherence, contextual alignment with national values, and relevance to the methodological requirements of primary education. This alignment enhances the feasibility of implementing the model in actual teaching practice. Expert evaluations confirmed that the proposed methodological approach has strong potential to elevate pre-service teachers' professional preparation. Experts highlighted the model's systematic structure, gradual implementation, rich use of creative tasks, and learner-centered orientation as key strengths. They also emphasized that successful implementation requires careful consideration of factors such as teacher preparedness, the availability of methodological resources, and time allocated for redesigning lessons.

Overall, the study demonstrates that developing creative competence through an integrative approach plays a vital role in improving the quality of primary education, ensuring strong coherence between teacher training, lesson design, and pupils' developmental needs. The methodological foundations proposed in this research may be further strengthened through practical experimentation, pilot projects, and the development of instructional materials designed specifically to support creative competence formation.

Conclusion

The findings of the study demonstrate that the development of creative competence in pre-service primary school teachers can be effectively achieved through an integrative approach. The systematic model comprising motivational, cognitive, practical, and reflective components enhances teacher preparation by enriching lesson content with innovative and creative activities. The principles of integration, problem-based learning, modelling, creative task design, and reflection constitute a solid scientific–methodological foundation for fostering creative competence. The practical implementation of the proposed methodological model contributes significantly to improving the quality of primary education by cultivating independent thinking, imagination, and creative decision-making skills in pupils. The model's step-by-step structure, universality, and interdisciplinary coherence expand its applicability in real educational settings. In the future, the creation of integrative lesson designs, a bank of creative tasks, and methodological resources based on this approach will ensure the continued advancement and practical effectiveness of the research.
