# EMPLOYING MODERN PEDAGOGICAL APPROACHES TO ADVANCE VOCABULARY DEVELOPMENT AMONG PRIMARY LEARNERS

**Turmatova Madinabonu**
madinabonumaxmutaliyeva@gmail.com

## ABSTRACT

The growth of vocabulary is a central part of the early development of children's speech and literacy, but many traditional teaching methods no longer meet the needs of modern elementary school. This study examines recent research on how modern pedagogical approaches can reinforce vocabulary acquisition in younger students. The quality review design was used to analyze academic resources published between 2000 and 2024, focusing on technology-supported learning, communicative practices, task-based learning, multisensory strategies, and differentiated learning. The results show that digital tools encourage participation and offer rich, multimodal access to new vocabulary; communicative and task-oriented methods encourage students to use vocabulary in meaningful interaction; multisensory approaches

## INTRODUCTION

Vocabulary plays a vital role in how young learners understand texts, express ideas, and succeed across all school subjects. Studies show that children who cultivate a robust vocabulary early on are more inclined to attain greater literacy and academic achievement (Nation, 2013). Nonetheless, numerous conventional methods, like memorizing vocabulary lists or rewriting definitions, fail to adequately address the learning requirements, interests, and attention spans of contemporary elementary school learners. Modern classrooms require more interactive, engaging, and student-centered approaches. (Beck et al., 2013). With advances in educational technology and new understandings of how children learn, teachers now have access to a wide range of innovative techniques. These include digital learning tools, communicative activity, task-oriented lessons, multisensory approaches, and various forms of learning. Such methods derive from modern educational theories, including Vygotsky's system of social education (1978) and Payvio's theory of double coding (1986), both of which emphasize the importance of meaningful interaction and multifaceted use in the educational process and are used in education.

This article is dedicated to examining how these modern pedagogical approaches contribute to more effective learning of vocabulary among primary school students. Considering current research and analyzing various teaching methods, the research provides insights into how vocabulary development can be enhanced in primary education.

### Methods

Research approach

To collect and summarize the current results of teaching vocabulary to primary school students, a qualitative review method was used. The approach aims to identify the main patterns and recommendations for several scientific sources.

Data collection

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889, 2024-6.875 ResearchBib IF: 9.948 / 2024

VOLUME-5, ISSUE-11

Relevant research, books, and review articles published between 2000 and 2024 were collected through academic databases such as ERIC, JSTOR, and Google Scholar. Search queries: "primary vocabulary training," "modern learning strategies," "digital vocabulary training," "task database".

**Data Analysis**

After collecting the resources, thematic coding was used to identify recurring ideas. Five main topics emerged:

1. Studying vocabulary using technology
2. Communicative and interactive methods.
3. Task-based learning strategies
4. Multisensor and multimodal learning
5. Differentiation for different learners

**Results and Discussion**

Technology as a Tool for Rich Vocabulary Exposure

It was widely recognized that digital platforms and educational programs increase student engagement, especially among young students. Tools such as online flashcards, animated storybooks, and dictionary games provide quick advice and repetitive practice, both of which improve word memorization (Alqahtani, 2015). Meyer's (2021) research supports the combination of visual, audio, and text elements to enable students to effectively memorize vocabulary and apply it in real life.

The modern age of technology allows children to learn new words in an interactive environment. Individual learning features, game-like tasks, and multimedia stories make vocabulary learning more enjoyable and more memorable.

Communicative approaches provide better understanding

Studies show that children's vocabulary naturally increases when they use words in real communication (Richards & Rodgers, 2014). Speech tasks, role-playing games, pair conversations, group problem-solving activities encourage students to use new words in meaningful situations.

Because young learners have a high probability of acquiring vocabulary in a short time when they speak, engage in controversial discussions, and engage in social relations. This reflects Vygotsky's (1978) idea that social activity contributes greatly to education.

Task-based learning encourages active language use

It is recognized that task-based learning is evaluated as an effective method of forming strong lexical knowledge. When students complete projects such as creating posters, planning imaginary journeys, chatting with classmates, or storytelling, they use background vocabulary to achieve real goals (Ellis, 2017).

TBL directs attention from memorizing words to their actual use. This deeper engagement helps students develop confidence in memorizing vocabulary and using it in real life.

Multisensory methods strengthen memory connections.

Young children learn most effectively when lessons engage their emotions. Movements, images, gestures, pictures, songs, and simple dramas help create strong connections between words and their meanings. Total Physical Response (TPR) that combines movement with speech, especially for elementary school students (Asher, 2009).

Paivio's (1986) double coding theory also explains how combining verbal information with images improves memorization.

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889, 2024-6.875 ResearchBib IF: 9.948 / 2024

VOLUME-5, ISSUE-11

These multimodal methods help students create mental connections that maintain long-term memory, especially for abstract or unfamiliar words.

Differentiated education supports all students.

In primary school there are different kinds of students with different kinds of knowledge, needs and learning abilities. Studies show that differentiated learning - the use of diverse materials, leveled vocabulary tasks, flexible grouping, and additional foundations - ensures the success of each student (Tomlinson, 2014).

By tailoring vocabulary lessons to individual needs, teachers provide more inclusive education where advanced students can improve their skills and where students experiencing learning difficulties can receive appropriate support.

**Conclusion**

The results show that modern pedagogical methods make a great contribution to the effective increase of vocabulary in primary education.. Digital tools provide an engaging, visually rich, and personalized experience. Communicative and task activity involves students in the real use of language. Multisensory tools help children remember words for a long time, Effective learning further increases the student's self-confidence and contributes to an increase in the level of knowledge. Through vocabulary learning, students not only reinforce their knowledge but also increase their self-confidence in life, participate more actively in lessons, and overcome shyness. As education continues to develop, it is necessary to introduce innovative approaches that help form the vocabulary necessary for the future academic success of student youth.
