Abstract: In this article, the professional motivation of teachers and the psychological and social factors influencing it are systematically analyzed. Professional motivation is explained as a complex psychological and social construct that determines an individual's attitude toward their profession, as well as the effectiveness and stability of their professional activity.

Keywords: professional motivation, pedagogical activity, psychological factors, social factors, intrinsic motivation, extrinsic motivation, self-confidence, self-determination theory, professional burnout, education system, Uzbekistan, teacher motivation.

Professional motivation is a dynamic and multifaceted psychological and social construct that defines an individual's attitude toward professional activity and ensures its effectiveness and stability. It develops and evolves in close connection not only with individual psychological characteristics (such as needs, values, goals, and emotions) but also with external socio-environmental factors (such as organizational culture, social attitudes, material and technical conditions, and the legal framework).

Due to the specific nature of pedagogical activity - including high responsibility, delayed results, significant emotional load, and multidimensionality - teachers' motivation demonstrates a complex dynamic influenced by the synergistic effect of various factors. This section provides a deeper analysis of the main psychological and social factors that affect the stability and effectiveness of professional motivation.

Psychological factors represent the core and stable foundation of motivation. They are rooted in the deeper layers of an individual's personality—such as values, needs, orientations, and emotional states—and mediate the influence of external factors.

The most important factor influencing a teacher's choice of profession and decision to remain in it is the degree of alignment between their personal value system and the content of their professional activity. According to Super's (1953) theory of career development, an individual chooses and develops a profession that provides opportunities to realize their personal values [41].

Pedagogical activity primarily provides opportunities to realize values such as altruism (serving others and society), creativity (generating innovations, expressing creativity), spirituality, and knowledge sharing. If a teacher perceives their work as a "vocation" or a "calling," their motivation remains high and stable despite external obstacles. In such cases, work is not only a source of income but also a means of personal spiritual fulfillment. Conversely, a discrepancy between values and professional activity (for example, the conflict between the value of earning money and

the low salary in pedagogy) creates a state of cognitive dissonance, which leads to a decrease in motivation.

Deci and Ryan's "Self-Determination Theory" (SDT) plays a crucial role in understanding and analyzing pedagogical motivation [43].

According to this theory, the quality and long-term sustainability of motivation are determined by the extent to which three basic universal psychological needs are satisfied:

Autonomy: The sense of control and freedom over one's activities, methods, and decisions. For a teacher, this includes the freedom to choose how to organize lessons, conduct pedagogical experiments, and work without undue pressure from others.

Competence: The feeling of effectively performing one's work, achieving success, and developing one's potential. A clear example is seeing one's contribution to students' learning and development.

Relatedness: The sense of establishing positive, trusting, and appreciative relationships with colleagues, students, and parents. This need is fulfilled within a healthy community environment.

When these three needs are satisfied, strong and stable intrinsic motivation develops, meaning that an individual engages in activities because they find them inherently interesting, meaningful, and valuable.

Extrinsic motivation (such as salary, rewards, prestige, and praise) serves only as a "hygienic factor" - it cannot be the foundation of motivation, but merely supports it or, if applied restrictively, may weaken intrinsic motivation. In the context of Uzbekistan, the degree of teachers' ability to make independent decisions (the need for autonomy) and the opportunities for continuous professional skill development (the need for competence) play a particularly important role.

Bandura's concept of self-efficacy is directly related to pedagogical motivation, referring to an individual's belief in their ability to successfully perform specific tasks [44]. A teacher with a high level of self-efficacy believes they can handle any pedagogical challenge (for example, managing a disruptive student or explaining a complex topic) and make a significant impact on students. This belief enhances their courage, initiative, perseverance, and, at the same time, their sense of professional responsibility. Professional development through training, courses, and mentoring programs not only updates their knowledge but also strengthens their self-efficacy, which directly contributes to an increase in motivation.

The teaching profession is among the most stressful occupations worldwide. According to the "Burnout" model developed by Maslach and Leiter (2016), the following three main indicators are key signs of declining motivation and decreasing professional effectiveness [45]:

Emotional Exhaustion: Depletion of emotional resources and a constant feeling of fatigue.

Depersonalization: Adopting a cold, detached, or impersonal attitude toward students and colleagues.

Reduced Personal Accomplishment: Dissatisfaction with one's professional effectiveness and achievements.

Therefore, a teacher's level of emotional intelligence and possession of effective stress-management strategies (such as accepting problems, positive thinking, reframing situations, using social support networks, and balancing work and leisure) determine their ability to maintain motivation over the long term and prevent professional burnout.

Social factors create the external context for the formation and maintenance of motivation and often determine the conditions for the full realization of psychological factors.

Herzberg's Two-Factor Theory remains relevant for analyzing pedagogical motivation [46]. When "hygienic factors" such as salary, working hours, office equipment, classroom conditions, and transportation facilities are inadequate, they become the main source of job dissatisfaction, sharply reducing motivation and increasing the desire to leave the profession. However, these factors alone are not sufficient to enhance motivation. In recent years, reforms in Uzbekistan

- such as gradual salary increases, construction of new school buildings, equipping classrooms with modern tools and computers, and providing housing opportunities for teachers in rural areas — have been aimed precisely at addressing these "hygienic" issues, creating the minimal foundation necessary for motivation.

The prestige and value of the teaching profession in society represent important social capital for its members. According to Parsons' theory of social systems, the status of a profession is determined by its significance for society, its function, and the level of specialized training required [47]. If a teacher takes pride in their profession and receives respect, appreciation, and recognition not only from the school but also from society at large (including parents and students), this strengthens their professional identity and self-esteem, which is a crucial component of intrinsic motivation. Conversely, low prestige and societal neglect of the profession lead to distrust, dissatisfaction, and weakening of professional identification. The "Law on the Status of the Teacher" [49] is aimed precisely at restoring and enhancing the social prestige of the profession and improving society's attitude toward teachers.

The school serves as the teacher's daily social micro-environment, and the following aspects have a decisive impact on their motivation:

Leadership style: Democratic, supportive, fair, and transparent leadership satisfies teachers' need for autonomy and encourages their participation. Conversely, authoritarian, controlling, and closed decision-making leadership undermines motivation.

Collaborative culture: In a team characterized by cooperation, mutual respect, assistance, and psychological support, job satisfaction and motivation are higher. Such an environment fosters collective efficacy—the team's shared belief in its ability to overcome challenges together [48].

Reward and career growth systems: Clear, transparent, and objective criteria for recognition, incentives, and career advancement create a sense of psychological safety, enabling teachers to experiment with new pedagogical methods, take risks without fear of mistakes, openly share ideas, and pursue professional development. Laws, state programs, strategies, and national projects (such as the "Spiritual Enlightenment" program, the activities of the "Youth – Our Future" fund, and the "Law on the Status of the Teacher") determine teachers' social protection, professional development opportunities, material well-being, and overall status. Legal guarantees (such as employment contract protections, pension rights, and leave entitlements) and their effective implementation in practice create a sense in teachers that they are supported by the state and that their work is valued, which positively influences their professional prospects, job security, and, consequently, their motivation.

In conclusion, teachers' professional motivation is shaped through the interaction of psychological and social factors. Internal resources (values, autonomy, competence, relatedness, self-efficacy) form the core of motivation, while external conditions (working environment, material incentives, social status, organizational culture, state policies) serve as supporting factors. Enhancing motivation requires a comprehensive approach that strengthens internal resources and improves the social environment, which in turn contributes to the development of a modern, committed, and professional generation of educators.
