Nukus city, Uzbekistan
E-mail: nurmakhanovk88@gmail.com

Abstract: This article is devoted to the issues of improving the methodological foundations for developing electronic educational resources in the context of digitalization. The research focuses on modern approaches, methodological models, and evaluation criteria for creating electronic educational resources.

Keywords: electronic educational resources, digitalization, methodological foundations, user-centered design, adaptive learning, microlearning.

INTRODUCTION

In the modern information society, digitalization is a global process that encompasses not only technological advancement but also social, economic, and cultural spheres. The field of education has not remained outside this trend. During the pandemic, the importance of electronic learning increased sharply, becoming not just a response to the existing situation but an essential component of a continuous, flexible, and personalized future model of education.

Electronic educational resources (EERs) are any materials created and distributed in digital format for organizing, implementing, and managing the educational process. They include multimedia textbooks, online courses, interactive exercises, virtual laboratories, simulations, video lectures, podcasts, and more. However, the development of EERs is often carried out without a systematic methodology—fragmented and focused solely on technology—which negatively affects their quality and effectiveness.

Digitalization represents a global process that covers not only technological but also social, economic, and cultural sectors. In recent years, especially during the pandemic, the significance of electronic learning has sharply increased, and it has become not merely a temporary solution but an essential part of the future model of continuous, flexible, and personalized education (Bates, 2019).

Electronic educational resources (EERs) are materials created and distributed in digital format for organizing, implementing, and managing the educational process. However, in practice, the development of EERs is often carried out without a systematic methodology—fragmented and focused mainly on technological aspects—which negatively affects their quality and effectiveness (Clark & Mayer, 2016).

The existing problem lies in the fact that the use of traditional didactic approaches in developing EERs often results in pedagogically ineffective resources. Therefore, improving the methodological foundations for developing electronic educational resources in the context of digitalization is an urgent scientific and practical issue.

For this reason, improving the methodological foundations for developing electronic educational resources during the digitalization process remains a pressing scientific and practical problem.

Main Part

1. Modern methodological approaches to developing EERs

The design and development of EERs fundamentally differ from the preparation of traditional educational materials. This process should be carried out based on the following modern approaches:

• **User-Centered Design:** The design of EERs must primarily take into account the learner's (user's) needs, abilities, and psychophysiological characteristics. This includes intuitive interface design, appropriate content coverage, and an optimal level of complexity.

• **Active Learning:** EERs should not function merely as tools for delivering information but should facilitate the learner's independent development of knowledge, skills, and competencies. This is supported by interactive elements (tests, quizzes, assignments), simulations, and case studies.

• **Microlearning:** It is increasingly difficult to maintain learners' attention for extended periods. Dividing information into small, focused, and quickly digestible modules (micro-lessons) addresses this issue and integrates learning naturally into daily life.

• **Adaptive Learning:** Using artificial intelligence and data analytics technologies, EERs can adapt to each learner's knowledge level, learning speed, and areas of difficulty. This ensures a personalized learning trajectory.

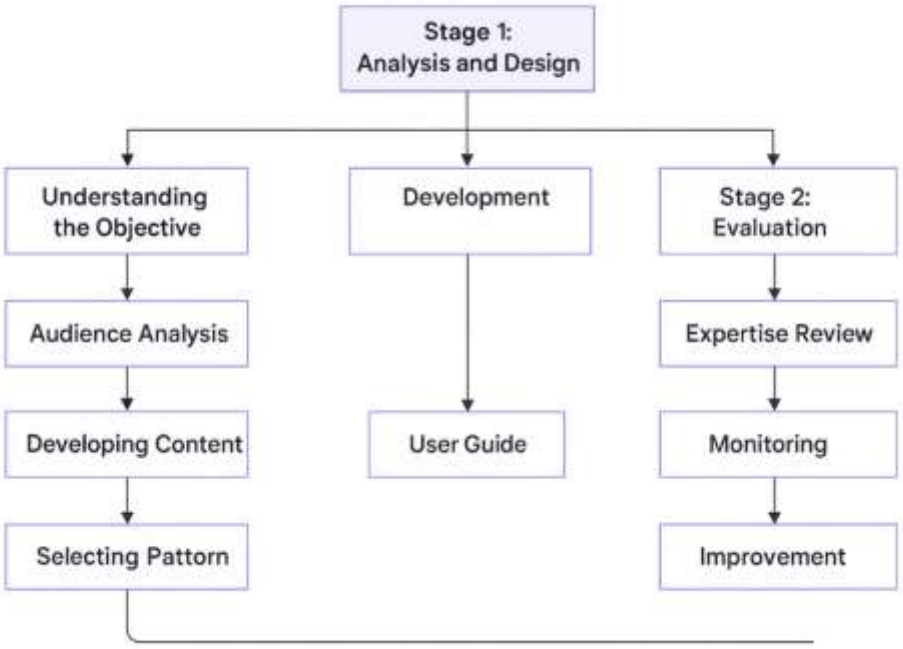

2. Methodological Model and Stages of Developing EERs

The improved methodological foundations for creating electronic educational resources can be represented within the following multi-stage model:

Stage 1: Analysis and Design

• **Identifying pedagogical goals and objectives:** What is the purpose of the EER? What knowledge, skills, and competencies should it develop?

• **Analyzing the target audience:** Learners' age, knowledge level, technological literacy, and psychological characteristics are studied.

• **Structuring the content and dividing it into components:** The learning material is organized logically, consistently, and in accordance with didactic principles. Based on the principles of microlearning, the material is divided into modules.

• **Selecting methodological and technological platforms:** Which tools and platforms (LMS – Learning Management Systems, authoring tools) will be used to develop the resource?

Stage 2: Development and Production

• **Creating and assembling content:** Text, graphics, audio, video, and animation materials are prepared. The content must be presented in various formats (visual, auditory, kinesthetic).

• **Adding interactivity and multimedia elements:** Tests, drag-and-drop tasks, virtual laboratories, videos, and other interactive elements are integrated to enhance learner engagement.

• **Developing design and interface:** A convenient, visually appealing, and functional interface is created following user-centered design principles.

• **Preparing methodological guidelines and instructions:** Clear instructions for teachers and learners on how to use the resource are developed.

Stage 3: Implementation and Evaluation

• **Expert review and testing:** The developed resource is tested by a group of learners and specialists. Errors and shortcomings are identified and corrected.

• **Pedagogical monitoring and analysis:** The effectiveness of the resource during the learning process is monitored. Learners' results and their feedback are collected and analyzed.

• **Revision and improvement:** Based on the collected data, the EER is continuously updated and improved.

3. Evaluation Criteria for EERs

To assess the quality and effectiveness of electronic educational resources, clear criteria are essential. The improved methodology considers the following core criteria:

- **Scientific accuracy and relevance:** The extent to which the provided information is scientifically valid and up-to-date.
- **Methodological clarity and comprehensibility:** Logical structure and ease of perception for learners.
- **Didactic quality and level of interactivity:** The degree to which the resource promotes learner engagement and active participation.
- **Technical quality and aesthetics:** Quality of graphics, clarity of audio, page loading speed, and user-friendly interface.
- **Innovativeness and originality of the solution:** The extent to which new pedagogical or technological solutions are applied.
- **Pedagogical effectiveness:** The positive impact on learners' knowledge level and motivation.

Future Development Directions

Creating electronic learning resources (ELRs) in the context of digitalization is a complex and multi-stage process that requires a specific methodology distinct from traditional didactics. Improving the methodological foundations of ELR development involves placing the user (learner) at the center of the process, applying active and microlearning principles, and establishing a clear stage-based model for designing, developing, implementing, and continuously evaluating the resource.

Such an approach not only ensures the creation of high-quality, engaging, and interactive learning materials, but also enhances the overall effectiveness of the educational process by fostering a personalized and flexible learning environment. In the future, it is advisable to continue research on integrating advanced technologies—such as artificial intelligence, big data analytics, and virtual reality—into ELR development, as well as studying their pedagogical effectiveness.
